

# You've taken one giant step

(like to try  
for two?)

Welcome to rung #1 on the ladder of success. If you're ready to keep climbing, Raytheon's SPACE & INFORMATION SYSTEMS DIVISION can provide all the tools you need to reach the top:

- **Technical Diversity** — As a SPACE & INFORMATION SYSTEMS DIVISION engineer, you'll take an active role in many of the world's most exciting programs. You will help build spaceborne guidance computers for the Apollo Command Module and Lunar Excursion Module. Or, perhaps you'll design and develop advanced radar, communications and reentry systems that will dramatically advance the state-of-the-art. Whatever the assignment, you will find diversity and challenge every step of the way.
- **Promotional Opportunity** — The company maintains and implements a long-standing policy of promotion from within which lets you rise to the top on your own merits. Case in point: Thomas L. Phillips, who began his career as a Raytheon engineer in 1951 and is now president of the company.
- **Continuing Education** — At SPACE & INFORMATION SYSTEMS DIVISION, keeping pace with technology is a way of life. Participation in educational assistance programs is strongly encouraged. A liberal tuition-reimbursement policy has been established by the company and major educational institutions such as MIT, Harvard, and Brown, are within easy access of the Division's Sudbury, Massachusetts headquarters.

You've spent years preparing for the "right" job . . . now take the time to select the "right" company. If you're ready for that second giant step, write: John C. Jones, Employment Manager, Department S, Raytheon Company, Space & Information Systems Division, 528 Boston Post Road, Sudbury, Massachusetts 01776.

## Like California, **TRW** is a state ...a state of mind.

Both California and TRW symbolize and embody the youthful and imaginative, yet systematic approach to problems as old as mankind and as new as tomorrow.

If you have that same frame of mind, you belong in California at TRW. Here, the university and industrial communities meet on common ground to an extent unmatched elsewhere. And, here you can enjoy the famed advantages of Southern California living plus opportunities for personal and professional growth within an organization already deeply involved in virtually every exciting and innovative project of our times.

If you see the ultimate reward of your profession as a chance to contribute importantly, not just to the advancement of technology, but to the application of technology to the solution of age-old (and some brand new) social and economic problems besetting our nation and the world... you belong in California at TRW.

How to get a spacecraft to a specific point on Mars... how to get a businessman from his home to his office... how to best serve the

medical needs of an entire state... these are typical of the problems you can help solve at TRW.

It is impossible to tell you everything about TRW here, but hopefully you will be interested enough to write us for more specific information.

TRW Systems is located just south of the Los Angeles International Airport in smog-free Redondo Beach—less than a mile from the blue Pacific. We are 13,000 specialists in engineering, science, and administration at work on diversified projects unmatched by any other company. And, TRW Systems is an operating group of TRW Inc., where 60,000 people are at work at 200 operations around the world, applying advanced technology to space, defense, automotive, aircraft, electronics and industrial markets.

At TRW you will be encouraged to continue your career development through the many educational opportunities offered by leading colleges and universities right in the greater Los Angeles area.

For your part in California at TRW, please make arrangements with the Placement Office for an interview, or write to Dr. William McIvers, TRW College Relations, Dept. CR-2, One Space Park, Redondo Beach, California 90278. You will hear from us shortly. In addition to Southern California, TRW Systems also has exciting career opportunities at Houston, Washington, Cape Kennedy, and San Bernardino, California. TRW Systems is an equal opportunity employer, m & f.

## Sundstrand systems serve a world in motion

The challenge of supersonic transport at Sundstrand includes development of a broad range of projects. Constant speed drive systems, hydromechanical transmission systems to convert variable jet engine speed to constant speed requirements of a c electrical generators; hydraulic pumps, for functional flight control service actuation; accessory drive systems, sophisticated transmissions to supply power for various aircraft accessories.

Sundstrand offers excellent career opportunities. Sundstrand engineers work on a variety of projects under excellent working conditions, enjoy definite project responsibility and follow-through. Our consistent emphasis on engineering results in a stable investment in research and development; when completed in 1967, our multimillion-dollar, 88-acre R&D center in Rockford, Illinois, will provide an additional 400,000 square feet for new product development, project management and testing. We employ nearly 6000 people, enjoy approximately \$100 million annual sales—a medium-sized company, on the move.

Consider a career at Sundstrand. SST, high-performance turbine design, thermodynamics, undersea propulsion, solid-state electronics, isotope power for space vehicles, computer programming, petrochemical handling, hydrostatic transmissions for vehicle propulsion—these are the tomorrow-oriented fields we investigate. Join us!

## Take off on SST at Sundstrand

Now that you know something about us, how about letting us know something about you?

Graduating  
Engineers:

## OPPORTUNITY AHEAD!

Explore these outstanding growth programs offering immediate rewards and unlimited futures with a leader in the field of aerospace communications and telemetry. Starting job assignments include the following categories:

### Electronics Development Engineers

—BS or higher in EE, duties to involve R & D and Product Design and Development in Communications, Analog/Digital, or other areas of advanced aerospace telemetry systems.

### Solid State Development Engineers

—BS or higher in EE, ME, Elec. Eng., Physics or Chemistry. Assignments, depending on degree discipline, will involve a variety of technical duties in advanced Solid State Production or R & D to include optical growth, diffusion, and thin film operations and microcircuit design.

### Marketing Management Engineers

—BSEE. Assignments in inside sales liaison or proposal management dealing with high level corporate customers and government agencies in the Aerospace field.

## how the 4:10 from Lake Charles helps feed a hungry world

Each day at the world's largest ammonia production facility, recently completed by Olin at Lake Charles, La., 1400 tons of ammonia is shipped to our fertilizer plants for critically food short countries.

Adjoining this gigantic complex is still another plant producing urea soil nutrient mixes. These and many other Olin plants making everything from pesticides to rocket fuel comprise the OLIN CHEMICALS GROUP which is playing an important role in the advancement of international health and knowledge.

There is virtually no limit to the potential uses of your talents at Olin where vast projects demand proportionate creativity and personal motivation.

**AT OLIN YOU'RE IN THE BIG LEAGUE—WHERE YOU BELONG!**

To complete these projects and accomplish our long range objectives we have exciting assignments for:

### **CHEMICAL ENGINEERS**

To work in process engineering at our plants, troubleshooting, conducting yield improvement, equipment and process modification studies; in process development of new products and processes; and in construction engineering on new plants and major expansions.

### **MECHANICAL ENGINEERS**

To work in project engineering at our plants analyzing equipment, systems, engineering specifications, standards and plant construction projects; and in maintenance engineering designing new and improved equipment with studies on plant and equipment layout; and in construction engineering on new plants and major expansions.

If you are interested in using  
all of your talents and potential, contact:  
Mr. Edward J. Kato  
Manpower Placement Officer

LTV ASTRONAUTICS DIVISION • LTV MICHIGAN DIVISION • LTV RANGE SYSTEMS DIVISION • LTV Vought AERONAUTICS DIVISION • KENTRON HAWAII, P.F.

# There's Room at Our Top

...and we'll show you how to get there

Fairchild Hiller's diversified and rapidly expanding aerospace programs offer the innovative engineering and scientific mind a rare opportunity for expression and direction.

And opportunity is only part of what we provide. The other part is challenge... and the stimulation of far-reaching programs at the frontiers of advanced technology.

At Fairchild we're working throughout the total technological spectrum of aircraft, space and electronics. Individual projects may range from concept and design all the way through systems engineering and manufacture.

To help orient you into your new surroundings, Fairchild Hiller provides continuing guidance through its College Relations Committee. You learn your job the fastest way... on the job, working with top rated engineers.

You will enjoy a superior working environment. The

recently completed Sherman Fairchild Technology Center, occupying a 165-acre site in suburban Washington, D. C., is among the most sophisticated facilities in the world for advanced technological achievement. Company facilities on Long Island, N. Y., St. Augustine, Fla., Los Angeles, Calif., and Hagerstown, Md., also present attractive and efficient working conditions.

Fairchild Hiller salaries and benefits are liberal. The benefits package includes group hospital and life insurance, a non-contributory profit-sharing retirement plan, and assistance to continue your education.

Yes, we do have room at our top. And we will help you get there.

For additional information, or to arrange an interview, check your Placement Office or write to: College Relations Administrator, Fairchild Hiller Corporation, Sherman Fairchild Technology Center, Germantown, Maryland 20767.

**You're invited  
to a happening**

The happening is today!

It's having brains—and using them.  
It's a feeling of personal pride.  
It's doing something *really* meaningful. It's getting out of yourself.  
It's challenging and changing the world. It's living. And doing. It's excitement. It's now.

It could be you. And IBM.

## What's happening at IBM?

Just about everything under the sun—and beyond.

Twenty years ago, the electronic computer was just a beginning. In that short space of time it has come to be called the most beneficial invention in history.

The pace of new applications is (literally) fantastic. Business, government, law, education, medicine,

science and the humanities. All are affected by IBM's information and control systems. *Positively* affected,

You may not realize it now, but chances are there's a place for you in the growing world of information and control applications.

Whatever your educational background, whatever your discipline, you could be a part of what's happening at IBM.

To find out where you fit into the contemporary scheme of things, see your Placement Director today, or write to:

Manager of Recruiting Administration, Dept. 747B  
IBM Corporate Headquarters  
Armonk, New York 10504.

IBM is an  
Equal Opportunity Employer.

**IBM**

It's what's happening—in computers and computer applications.

# INTERESTED IN A REWARDING CAREER IN AEROSPACE/ELECTRONICS?

You can go forward, go fast, go far... at Hughes Field Service & Support Division.

If you are seeking a stimulating assignment where you can get in on the ground floor of the rapidly-expanding aerospace/electronics field, capitalize immediately on your background and training, and progress quickly toward your career goals—Hughes Field Service & Support Division in Southern California will welcome your inquiry.

Some of our current fields of interest include:

## DESIGN ENGINEERING

Openings exist for Electrical and Mechanical Design Engineers in the development of Trainers & Simulators and in the design of checkout and test equipment for large missile and aerospace systems. These responsible positions require interest and/or experience in such design areas as: analog circuits, digital logic, switch/relay logic, electromechanical packaging, infrared testing,

inertial guidance and Command/Control systems. Responsibilities will include all phases of development from concept to final fabrication and evaluation. B.S. degree is required in E.E., M.E. or Physics.

## FIELD ENGINEERING

The Field Engineer's job ranges from complete contractor maintenance of electronic systems to technical assistance. His primary function is to help the customer become self-sufficient. Responsibilities include: providing maintenance, operational and technical assistance; formal and informal on-the-job training; logistic assistance and the investigation and solution of equipment problems experienced in the field. Domestic and overseas field assignments are available. Requirements include: B.S. degree in E.E. or Physics and experience with military fire control, radar or communications systems.

## TECHNICAL TRAINING

Hughes Technical Training prepares both civilian and military personnel to efficiently operate and maintain advanced electronic systems. Technical Instructors conduct training classes at Hughes California sites and domestic field locations... and work directly with customers to evolve special training devices, plan field training programs and prepare courses for use at customer bases. Requirements include: B.S. degree in E.E. or Physics and experience in preparing and presenting technical electronics material in the classroom and laboratory.

## ENGINEERING WRITING

Specialists in printed communications convert complex engineering data into simple, accurate, illustrated support publications, including technical manuals, orders, brochures, sales proposals, etc. Fields of interest include: digital computers, digital and voice communications systems... and many others. Requires a B.S. degree in E.E. or Physics.

## U.S. Citizenship is required

For immediate consideration, please airmail a complete resume of your background and experience to:

MR. B. P. RAMSTACK

# OUTSTANDING ENGINEERING OPPORTUNITIES AT BAXTER/TRAVENOL

(we've grown 400% in 10 years)

A quick look at our growth chart tells you that being associated with a company like ours can make your work professionally rewarding.

And there is an extra reward, a rare thing not found everywhere. It is the additional satisfaction that you get from working on projects that prolong life... that make history through science.

You will join a team of the nation's top researchers and innovators, working with advanced equipment in ultra modern facilities. The scope of your work will range all the way from everyday challenge of product and system improvement to the kind of scientific breakthrough that creates better, longer, less restricting life.

You will rise to the challenge of a new idea. Whether you are a seasoned professional or are still in school, you should investigate the opportunities with us in bio-medical engineering, production engineering, machine design, process and product development, quality control and production management. We need bright and alert technically trained creative minds in all engineering fields at the B.S. or M.S. level. Many new opportunities exist with our domestic subsidiary, Travenol Laboratories, in Morton Grove, Illinois (a suburb of Chicago) or in our other plants and offices located throughout the world.

Write today for a descriptive brochure that will tell you more about us, our growth and our many engineering opportunities.

AN EQUAL OPPORTUNITY EMPLOYER

## COLLEGE MAJORS in ENGINEERING, SCIENCE or MATHEMATICS . . .

If you seek a career where you can roll up your sleeves and meet challenges that demand imagination and a capacity for experimentation—

## CHRYSLER SPACE DIVISION CAN OFFER YOU SUCH A CAREER

Chrysler offers the gifted engineer, scientist or mathematician an opportunity to play a central role in the most engaging of all dramas—the exploration of the universe. For, as Chrysler Space, with an unprecedented record of reliability, continues to fulfill assignments as a prime contractor in the Apollo Program, it is also

engaged in activities related to future space programs. These include conceptual design studies of spacecraft and systems, and work on Orbital-Astronomical Facilities, Thermo Probes, Thermo Insulation Base Heat Shields, Configuration Management, Interface Control, Extra Vehicular Activity and other programs.

Chrysler Space has career openings in a broad spectrum of disciplines, such as:  
**APPLIED SCIENTIFIC RESEARCH • SPACECRAFT DESIGN • CONTROL & STABILITY  
 SPACECRAFT ATTITUDE CONTROL SYSTEMS • PROPULSION & POWER SYSTEMS  
 FLIGHT MECHANICS ENGINEERING • TRAJECTORY & ORBITAL ANALYSIS  
 ELECTRICAL & ELECTRONICS SYSTEMS • COMMUNICATIONS & DATA HANDLING  
 HUMAN FACTORS • SPACE PHYSICS • MANUFACTURING RESEARCH  
 DATA REDUCTION ANALYSIS • MATH ANALYSIS • ANALOG ENGINEERING**

Whatever your present level in college, Chrysler would like to discuss these careers with you.  
 For complete details, write to:

Mr. R. C. Radick, Personnel Dept. EOC  
 P. O. Box 29200, New Orleans, La. 70129

SPACE DIVISION

**CHRYSLER  
CORPORATION**

Positions in New Orleans, La., Huntsville, Ala., and/or Cape Kennedy, Fla. • An equal opportunity employer

## mechanical— civil— engineers

. . . to work on integrated problems in the field of Shock, Vibration, Noise Control and Structural Dynamics involving static and dynamic analysis of the systems development and design of isolators, dampers and associated hardware, steel frames, concrete bases, foundations, light gage steel and aluminum acoustical enclosures with steel or aluminum framing.

**BS—MECHANICAL ENGINEERING** with good background in Mechanics (static and dynamics) and strength of materials.

**BS—CIVIL ENGINEERING** with good background in stress analysis, steel and concrete structures.

Opportunities also available for Application Engineers interested in Acoustics for the Noise Control field. Will handle application of acoustical enclosures, ventilation duct silencers, damping compounds and other related Noise Control products.

Join our on-the-job training program, leading to various Engineering positions in home office or throughout the country.

Company benefits include college tuition refund program for graduate degrees, health and life insurance programs, profit sharing plan and others.

Interested applicants should forward resume and salary requirements to:

Mr. D. H. Vance, Executive Vice President  
 Korfund Dynamics Corporation  
 Cantiague Road • Westbury, L.I., N.Y. 11590

**SALSBURY  
LABORATORIES**

Opportunities in:

**CHEMISTRY  
ENGINEERING  
MICROBIOLOGY**

This Company's sound and rapid rise in the pharmaceutical and chemical field offers a promising future for management oriented persons in the organization and planning of an expanding company development program.

Openings in the following classifications:

- ANALYTICAL CHEMISTS
- ORGANIC CHEMISTS
- CHEMICAL ENGINEERS
- INDUSTRIAL ENGINEERS
- MICROBIOLOGISTS

Send resume to:

Personnel Manager  
 SALSBURY LABORATORIES

## ENGINEERING GRADUATES!

... An open world of opportunity\*  
awaits you at RAYTHEON

... One of the world's most diversified scientific-industrial companies, Raytheon's Equipment Division specializes in radar, communications, and data processing systems. The Company is a leading producer of components and complete radar systems for both military and non-military use. In the growing communications market, the Company is supplying complex microwave radio and telecommunications systems for both government and commercial usage.

The Division is located in suburban Boston... an area that provides a combination of urban and rural living. Boston is a cultural and educational center. Cape Cod is only a short drive away; and the White Mountains are easily accessible via New England's superhighway system.

\* Receive specific job assignment as a professional engineer in one of the following areas:

### SYSTEMS

Radar/Communications  
Data Processing and Displays

### DESIGN

Logic  
Digital  
Analog  
Reliability

### MANUFACTURING

Industrial Methods  
Manufacturing Liaison  
Quality Assurance  
Production Planning

### FIELD SUPPORT

Installation  
Maintenance  
Operation  
Overseas/Domestic Assignments

- Receive formal advanced educational assistance for Master's, Doctor's Degree, and advanced course work at one of Boston's major educational institution...
- Receive advancement based on individual merit.

EXCELLENCE IN ELECTRONICS  
An Equal Opportunity Employer

If your answer is yes, and you mean it, you may be surprised to learn you're a rare animal. You're also the kind of professional engineer who belongs at Sprague Electric.

A professional is more than someone who gets paid. He's a man who does his best, all the time. Even when no one is watching him.

At Sprague we recognize the value of professionals, which is probably why our engineering turnover rate is about the lowest in the industry.

As the nation's largest, fastest growing manufacturer of electronic components, we're looking for more professionals to join us. We have 25 plants in the U. S. (including a new 130,000 sq. ft. microelectronics facility in Worcester, Mass.) and we have opportunities in nearly every one of them.

In fact, we have more opportunities than we can sensibly squeeze into one advertisement. So if you don't see your particular qualifications in the following list, call or write to us anyway. We may both be pleasantly surprised.

#### **ELECTRICAL/ ELECTRONIC ENGINEERS**

Solid State Circuit Product Development • Digital Circuit Design • Pulse Forming Networks • Component Test Equipment Design • Integrated Circuit Design • Component Q. C. • Linear Circuits Design • Microcircuits Development • Manufacturing Engineering • Interference Control • Instrumentation • Miniature High Voltage Fabrication • Regulator Design • Semiconductor Test • Semiconductor Reliability • Product Marketing • Magnetic Components Design • Electrical Standards Engineering • QAR Engineering • Integrated Circuits • Production Engineering •

#### **CHEMISTS/PHYSICISTS/ CHEMICAL ENGINEERS**

Paper, Film, Ceramic, Electrolytic or Tantalum Capacitor Development • Microcircuit Product and Process Development • Organic Finishes and Molding Compounds • Hybrid Microcircuit Process Formulation • Electronic Component Process Development • Pilot Plant Supervision • Evaporation Techniques • Materials Processing Engineering •

#### **MECHANICAL/ INDUSTRIAL ENGINEERS**

Automatic and Semi-Automatic Manufacturing Equipment Design • MIL SPEC Electronics Assembly Production • Materials, Methods and Processes Engineering • Machine Design • Production Control (Manager) • QAR Engineering • Capacitor Production Equipment Planning • Time Study.

At this point you can either answer this advertisement immediately or file it away for future reference. We'll have opportunities available at Sprague Electric next month. And next year, too. However, by then you may be reporting to the man who answers this ad now.

For prompt consideration of your qualifications, contact your College Placement Officer or forward your resume to Mr. Joseph J. Lodge, College Relations Coordinator, 913 Marshall Street, North Adams, Massachusetts 01247. An equal opportunity employer.

**IF WE  
GAVE YOU  
YOUR HEAD,  
WOULD YOU  
WORK  
IT OFF?**

Kevin Truex is now working on stress and vibration problems for the world's leading developer of gas turbine engines. Frankly, we could have used him in experimental test, but he knows where he gets his satisfaction better than we do.

**This is Kevin Truex, Class of '66.  
We want to move him up a notch.  
Are you good enough to take his place?**

**AN INTERVIEW IS YOUR FIRST  
MOVE TOWARD A GROWING FUTURE!**

Kevin Truex is just one of many '66 grads whose future looks very promising at Avco Lycoming. We've known that for some time — even though we've known Kevin for less than a year.

Good men like Kevin Truex get recognition fast at Avco Lycoming.

For one thing, they quickly find themselves in a job that fits not only their qualifications, but their own particular interests as well. Avco's Engineering Training Program gives them a chance to see . . . and actually work in . . . many different areas of engineering before they settle on one to grow in.

For another, their formal education needn't stop when they come to work with us. Graduate programs at Columbia, NYU, RPI, Bridgeport, Connecticut, and Brooklyn Poly are among those available under a full tuition reimbursement plan to all Avco engineers.

To arrange an interview, see your College Placement Officer or write Professional Placement Manager, Dept. 184, Avco Lycoming Division, Stratford, Conn.

#### **ABOUT AVCO LYCOMING . . .**

Avco Lycoming has been a leader in the research, development and production of aircraft engines since 1928. In 1953 we introduced the first gas turbine engine for helicopter applications. Today we are the world's leading developer of gas turbine engines for helicopters and other power applications. As evidence of our leadership in this constantly growing field, more helicopters throughout the world today are powered by Avco Lycoming engines than by any other manufacturer. We are also a producer of components for America's space program.

Explore the challenging world of Avco Lycoming.

## Career on Your Mind?

Think Future. Think Celanese. If you're ambitious, flexible, and imaginative—and if you're well trained in chemistry, chemical or mechanical engineering, physics, marketing or accounting—you're our man.

Why Celanese? You'll be working for a company that's growing fast—and "plans" to keep growing. 1965 sales rose more than 25% to about \$900 million. Our future "planned" growth depends on our ability to attract top-notch people who have the drive and desire to aim for that second billion.

What makes you tick? Responsibility. Authority. Professional Recognition. Financial Reward. We know of no other

company better able, or more disposed, to satisfy these needs. Working with Celanese, you'll have the chance to grow and broaden quickly.

Sound good? If you feel you can perform in our demanding environment, it should. Discuss us with your faculty and Placement Office now, then plan to see our representative when he is on your campus—regardless of your military commitments. Or write to: John B. Kuhn, Manager of University Recruitment, Celanese Corporation, 522 Fifth Avenue, New York, New York 10036.

AN EQUAL OPPORTUNITY EMPLOYER

E/O COLLEGE EDITION

## You won't start all over again

## when you start at AIRCO

If you are about to get a degree in science, engineering, or business, or if you already have one, AIRCO will treat you as a graduate. You won't mark time "observing." You'll learn through accomplishment. Contribute while learning. It's the difference between making progress and marking time.

There's plenty of room at AIRCO for you to make all kinds of progress. In research, development, production, marketing, finance, accounting, or administration. We're a big company—over \$400 million in sales with 14,000 employees. We have a reputation for forward thrust. We started over 50 years ago in industrial

gases. From there we expanded into producing and marketing some of the most advanced products in American industry.

Cryogenic fluids and equipment. Welding, cutting, and steel-conditioning equipment. Arc welding electrodes and wires. Chemicals: monomers, polymers, special-purpose resins and emulsions, surfactants, calcium carbide, acetylene and other acetylenic chemicals. Carbon and graphite products. Electronic components. Ferroalloys. Medical gases and related hospital equipment. Plastics products (vinyl-coated fabrics and molded vinyl plastics). Carbon dioxide, related equipment and supplies.

AIRCO has over 200 major production, research, and sales facilities in the United States and Canada. Plenty of good places to launch your career.

We have the usual fringes. But who ever made it big on his fringes? We offer much more: we offer intelligent, productive work and experience which can put you on top in your field.

For additional information, consult your college placement office. You will also receive a prompt reply if you write or send a résumé to: Mr. F. J. Spinner, Technical Placement Coordinator, Air Reduction Company, Inc., 150 East 42nd Street, New York, New York 10017.

An equal-opportunity employer

FEBRUARY, 1967

# Changing Education for a changing role

■ Max Schulman's anti-heroic lower classman, torn by conflicting advice as to whether his stay at the university should make him "a well-rounded individual" or prepare him to earn a living was a caricature with whom it was not difficult to identify if you just hark back to your own freshman days.

In scientific and engineering education in particular, a very real battle has raged among educators for generations as to just how much concentration on the purely technical side of education is good for the long-term interests of the student and the community into which he will graduate. Within the past 10 to 15 years, developments have combined to make the question ever more debatable. The veritable explosion in technical knowledge demands more and more concentration on technical courses. In almost any discipline, four years is rapidly becoming too short a time to cover technology alone, if the student took not a single course not directly related to his major.

At the same time—within the same period—the role of the engineer and scientist in both the business and the political community has expanded rapidly. Twenty years ago, the route of progression for the young engineer or scientist was predictably *vertical*—within the confines of the research lab or the engineering department. Today, that route is quite likely to run from the drawing board to the directoral board; cutting across many different levels of administrative and executive responsibility in the course of a few years.

Four to six years of a course necessarily top-heavy with electronics, chemistry or physics may be all the educational preparation a young man gets for a career that is going to lead him from the lab or the engineering department to the presidency of his company and into important executive or advisory posts in local or federal government.

The dean of the science school may argue—with great justice on his side—that what has been learned about electronics, for instance—since the time he studied it—adds up to more than can logically be packed into a four-year course of study. Understandably, he fights for a curriculum affording added hours of technology, at whatever expense to the few remaining hours of the humanities still included in a science course.

The dean of men and the president of the

university, on the other hand, tend to see this proposed curriculum as a means of spawning a generation of sociological idiots with no preparation for the sort of jobs to which technological beginnings lead today and with no background for appreciation of the sociological impact of the products of engineering and research.

That *both* these positions are substantially right is difficult to debate. Where, then, lies the answer?

There have been a number of proposals. The tech school might well be made into a four-year, undiluted course graduating a sort of super technician, with no pretense of providing an over-all education. By taking much the same course *after* two years of liberal arts (with, perhaps, a little extra emphasis on math) the student might receive a master's degree, and this would be the first degree conferring "professional" status.

"But," cries the purist, "apart from formalizing the two types of courses with some distinctive names, this is what we already have; and it doesn't seem to satisfy *anyone*!"

"But," cries the technologist and the hard-pressed recruiter for industry, "all *that's* going to do is add two years to the lead-time involved in producing the engineers that we need *now*, not six years from now!"

"But," screams the irate parent, smarting under the necessity for squeezing a couple of thousand dollars per semester out of a tight-stretched budget, "the kid is going to be middle-aged before he earns his first dollar!"

Or, it has been proposed that the basic four-year science course be revised to provide a firm foundation of science and humanities on which graduate studies can be used to build professional stature in some—virtually *any*—specific technological discipline.

This might produce a bumper crop of "well-rounded individuals" and thus satisfy the purist, but it still won't do much to allay the complaints of the others quoted above. After four costly years, the hard-pressed parent will find himself with a child so "well-rounded" that he can't earn a living at *anything* without two to four more years in some form of specialized course. The industrialist and his recruiter will find the undergraduate school as sterile as today's junior highschool as a source of sore-needed junior engineers and scientists.

Using the "mandala," an ancient artistic device common to far-eastern civilizations, Artist Allan Dougherty of TRW symbolically represents the nuclear atom of the human psyche and the multi-faceted character of the human mind. The mandala (the Hindu word for "magic circle") is used in many eastern civilizations by the individual seeking to explore his own unconscious with the goal of forming a balanced and harmonious relationship with the Self. Educators, seeking to balance technical education with the humanities during an explosion of technical knowledge may see in Dougherty's creation the long-sought "well-rounded individual."

Robert W. Balluffi, a professor in Cornell University's department of materials science and engineering, Ithaca, N. Y. (left), transmits course in physical metallurgy to scientists and engineers at the Sylvania division. Using an electronic pen, he draws diagrams and writes words and other graphics which are transmitted over telephone lines for display on a television monitor in the Towanda classroom 55 miles away. His voice is carried at the same time to a speaker system. Students may ask questions by pressing an indicator button in the classroom. This activates one of the "question" lights on the instructor's console. By depressing the switch under the activated light (as shown), he can talk with the students. The system, which was designed to help meet the rapidly expanding needs of modern education, was developed in Bedford, Mass., by Sylvania's Commercial Electronics Division.

An electronic "blackboard-by-wire" teaching system recently transmitted voice communications and handwriting over telephone lines for long-distance illustrated lectures at a demonstration jointly sponsored by Purdue University and General Telephone & Electronics Corporation. The new system, introduced last May, enables students (right) to receive course material with graphic material being presented on a classroom TV monitor. The instructor's voice is heard through a classroom speaker system. The handwritten information remains on the TV monitor until the instructor presses an "erase" button at his console. Students can ask questions or comment on the lecture by pressing a "question" button in the classroom. The instructor then activates a return audio circuit which permits the students to talk with the transmitting location. Up to six remote receiving locations can be operated from one transmitting console.

And the community may begin to find that the science grad is not even an expert in his own field; hence not to be considered as either executive or advisor, even with skilled direction. A politically and sociologically "naïve" Oppenheimer could be of incalculable value to a technologically "naïve" government; but one may logically wonder what a "well-rounded" Oppenheimer would have been able to contribute. Which four hours of physics could he have sacrificed for History of Civ and still have been able to make his vital contributions?

Are we, perhaps, trying to *mass-produce* Aristotles and DaVincis—the sort of men for which Nature herself finds the pattern only once or twice in a millenium? And, if we are, is that too wild a dream? How many potential Leonardi went to their graves recognized only in the one field to which they had been *exposed*? Or, perhaps, totally unsung because they had never been exposed to the *right* field?

Without even thinking of how to restructure education, the universities already have their problems in terms of how to give—most efficiently—*today's* standards of education to the greatest possible number of students.

The school's best instructors may not even be on campus; they're across town (or perhaps across the country) working on a government research task, or in Washington advising a cabi-

net officer or congressional committee. Or they may be on campus but tied up full-time writing reports and proposals which may bring in the research grants needed to keep the graduate school afloat.

For the research grant is not just a status symbol to most universities today—it's a way of life! With "physical plant" investment per *undergraduate* student getting up into six figures (and for each graduate student, into seven figures in many schools) neither state funds nor endowments can keep a big school above water. A bare half-dozen grad students in nuclear physics, for instance, may need a computer complex (or a commanding amount of shared time on one) plus a particle accelerator and a nuclear reactor each priced well up in the millions.

How does the university provide either the top-flight instructors or the expensive hardware required to make attendance there worthwhile to the student or the community?

One answer gaining considerable impetus is the graduate consortium "approach. Under this approach, a number of universities may each surrender the scholastic dream of being "all things to all men" and make the best of the faculty talents and physical facilities of each university available to graduate students of all of the universities. The individual schools in a given area (perhaps involving several states) may give up the effort to maintain the faculty

and facilities needed to maintain individually *good* schools of astrophysics, for instances that one may be able to maintain a *superlative* school to which the students of all are welcome.

While the economics of this approach are conspicuous and convincing, it has not been sold anywhere without some pains. The consortium technique, however, is helping schools in many areas to minimize individual investment in overlapping facilities as well as to make the services of top-flight educators available to far more students.

Another approach to the problem of faculty shortages lies in increasing use of electronic media to permit one highly qualified lecturer to reach students in scattered locations without resorting to the "circuit-rider" technique. Rather than lecturing at several schools on successive days, he may now lecture at several schools simultaneously via closed-circuit television and, through an associated phone circuit, be able to question—and be questioned by—students at any of the locations individually.

While closed-circuit TV is, today, hardly a novelty even in the highschool, it has usually lacked the all-important capability of permitting the student to ask, "Professor, precisely what did you mean by your statement that . . .?" By adding the phone channel, most of the advantages of "presence" are regained.

While neither the consortium nor the closed-circuit seems likely to provide all the answers to technical education—most specifically not the answer to the design of any curriculum short of a "life sentence" which will satisfy the wishes of all concerned—each probably will be a lasting force in education if only for the one or two problems for which it does present a partial answer.

A commuter trip to another near-by campus or a flip of the switch to the proper channel may go far toward making available the talents of an instructor which you might otherwise miss; but neither adds a single minute to the 168 hours in the student's own week. If Moses, Plato and Saint Peter were all lecturing six days a week on campus, it would not provide any answer to how today's tech student could fit their courses into his schedule!

The only real answer may well lie in an engineering or science course involving two years of "junior college" type Liberal Arts & Sciences studies followed by at least three and possibly four years of concentrated technical courses. As noted earlier, this is not likely to find anything like universal approbation among the many people concerned; but it may well result in a lot more engineers and scientists who fit more closely the pattern required by their own best interests, those of their employers and those of their community. ■

**Welcome  
to the cold,  
cruel world.**

Of course, if your father's a millionaire, or you're about to marry an heiress, then you have no problems. But, if not, then there's only one sensible thing to do. Come to work at Allison Division of General Motors.

There's nothing cold or cruel here. Just the opposite. Particularly if you're an engineer with big ideas. Aerospace projects? Allison's got them. Turbofan. Turbojet. Turboprop. Turboshaft. Military and commercial applications right across the board.

Maybe you're more down-to-earth. Fine. Some of Allison's advanced motor vehicle projects will be more your cup of tea. Like the new M551 General Sheridan, for instance. The powershift transmission, of course, is our specialty, and even the gun launcher is an Allison brainchild.

There's more. And you can be part of it. Take your time. Check them all. But don't forget Allison. Remember: life can be beautiful . . . even without an heiress.

Send for Allison's new brochure: Destination Tomorrow. Write Scientific Placement, Dept. 204 Allison Division of General Motors, Indianapolis, Indiana 46206.

MARK OF EXCELLENCE

**Allison**  
An equal opportunity employer M/F

AT NASA, YOU'RE IN THE AEROSPACE CENTER OF THE FREE WORLD

# NASA...your place in space

**NASA programs encourage swift professional growth  
for the engineer or scientist launching his career**

Accelerate your career swiftly as a professional staff member of the National Aeronautics and Space Administration. Stimulating assignments, unequalled resources, liberal programs of educational assistance, early responsibility—all help hasten the professional growth of the engineer or scientist who chooses NASA for his initial career position.

Each NASA Center offers its own comprehensive plan to help advance your knowledge and speed the time when you can contribute at the peak of your capacity.

## Advance Academically

NASA Centers have established close relationships with nearby universities and colleges. As a professional staff member you may pursue work-related graduate study at NASA's expense. Courses may be taken in the evening or with your work hours adjusted to meet a given schedule of classes. Opportunity for full time graduate study at full salary is also available.

## Advance Professionally

Opportunities are numerous to help you grow in your profession. Staff members are encouraged to affiliate

with professional societies and organizations and to keep abreast of the latest technical and scientific developments by attending their conferences. You are also encouraged to attend courses, seminars and symposia sponsored by major academic institutions and industrial, military and governmental organizations.

## Advance Through Training

NASA Centers conduct their own training programs which include lectures, seminars, films and expense paid trips to other organizations. You will also be given the opportunity to study and work closely with one or more senior NASA scientists or engineers, who are leaders in their field. This is an informal and exceedingly productive arrangement which is designed to bring you very rapidly to the forefront in a special technical or scientific area.

## Information About NASA

Learn more about your future with NASA. Contact your College Place-

ment Officer to arrange an interview with NASA representatives visiting your school, or send a letter outlining your interests and background to the Personnel Officer at any one of the following NASA locations: NASA Ames Research Center, Mountain View, California; NASA Flight Research Center, Edwards, California; NASA Goddard Space Flight Center, Greenbelt, Maryland; NASA John F. Kennedy Space Center, Cocoa Beach, Fla.; NASA Langley Research Center, Hampton, Virginia; NASA Lewis Research Center, Cleveland, Ohio; NASA Manned Spacecraft Center, Houston, Texas; NASA Marshall Space Flight Center, Huntsville, Alabama; NASA Wallops Station, Wallops Island, Virginia; NASA Electronics Research Center, Cambridge, Mass.

Positions filled in accordance with USCSA Announcement 347B. Qualified applicants considered without regard to sex, race, creed, color, or national origin.

FEBRUARY, 1967

■ About 330 BC, Alexander The Great rigged a crude diving bell and descended to a depth of approximately 50 feet in the Aegean Sea. He surfaced with the sort of succinct observation which marked him as "Great": "Everything down there eats everything else." Only quite recently have modern students of the ocean much surpassed the depth of either his dive or his profound scientific commentary!

# MAN and the SEA

■ "Within 50 years man will move onto and into the sea—occupying it and exploiting it as an integral part of his use of this planet for recreation, minerals, food, waste disposal, military and transport operations, and, as populations grow, for actual living space."

The author of these prophetic words, Dr. F. N. Spiess, is the head of the Marine Physical Laboratory of the University of California's Scripps Institution of Oceanography at La Jolla, and may therefore be presumed to know whereof he speaks.

To anyone who observes the eddies and currents of science, it is quite clear that man's move to the sea has already begun. Interest in underwater technology is today at an all-time high, and each year more and more young scientists and engineers are being attracted to the glamor which today attaches to the exploration of "inner," rather than "outer," space.

Moreover, as Arthur C. Clarke is fond of noting, scientists are all too often prone to underestimate, rather than overstate, what man is capable of doing. There is little doubt in the minds of Jacques-Yves Cousteau, Scott Carpenter, and other Aquanauts, as well as oceanographers, that Dr. Spiess is being conservative, and that man will be living on or in the sea long before 50 years have gone by.

To make their point, they note simply that pressures on earth (or at least that part of it which is land, rather than water) are already such as to force man to move from the land onto and into the sea in the very near future, particularly since such a move can be accom-

plished much more readily, and much more rapidly, than the only other alternative—a move into space.

With the earth's population expanding more rapidly than at any time in history; with living space available only in limited areas and at a high premium; with the air over our larger cities rapidly becoming unbreathable and the water undrinkable; and, with the food that can be harvested from the land already inadequate to support even the world's present population, man's move to the sea—and into space as well—is inevitable.

It has frequently been stated that underwater technology is nothing more than oceanography put to practical use. Faced with the realization that exploration and exploitation of the sea is today of such urgency that this effort requires a priority equal to that of the national space program, the United States is now spending about \$135-million annually on underwater research, and this figure is expected to rise to about \$350-million by 1972. Spending during the 1962-1972 period is expected to total \$2.2-billion, and could conceivably go higher than that.

As an example of the concern the Government feels about this field, it's interesting to note that Congressional interest has increased to a point where there are some different 40 committees and subcommittees involved with the authorization of expenditures by some 20 different agencies on oceanographic research and technology. In addition, there are more than a dozen bills dealing with underwater programs before Congress.

# NORTON MAKES

&

\*Curiosity getting the best of you?  
Go right to the third paragraph.

Did you draw a blank? Don't feel badly. Some engineers do. That's why we're running this announcement.

People keep confusing us with Norden (the bomb sight people) and Morton (the salt people). While we're flattered no end at the company, we want to be known for what we do.

And what we do is make bonded and coated abrasives, machine tools, masonry cutting equipment, pressure sensitive tapes, high temperature refractories, tower terminal packings and extruded plastic tubings.

Sound like a lot of work? You're right. That's why we need you

if you're a research-, production-, or sales-oriented engineer with ambition to match his abilities.

What do we have to offer? The stability of an old line company (established 1885). The expandability of a new company (we've added 3 major divisions in the past 4 years). An interest-holding diversity of assignments (we have 48 plants in 17 countries, covering 10 principal product lines). An open field for rapid advancement (we have a smallish staff, promote from within). An engineer oriented working climate. And handsome compensation (it includes fringe benefits worth as much as 25% of your salary).

Now you know about us. How about letting us know about you? Just write, in complete confidence, to Mr. Breck Lardner, Supervisor of Recruitment, Norton Company, Worcester, Mass.

**NORTON COMPANY**  
Worcester, Mass.

A good company to know,  
A great company to work for.

Behr Manning • Clipper  
National Research • Norton  
Norton International • U.S. Stoneware

An Equal Opportunity Employer

When man's far-distant progenitors slithered out of the sea to take up abode on dry land, the specie seems to have virtually lost interest in its old home. For countless millenia, man went back to the sea only as a source of food or to use its broad surface as a highway to other bits of dry land.

Here Artist John Desatoff of TRW portrays how a section of the coast off Santa Monica may look if current ideas of oceanological developments become realities. The floating hotel affords massive underwater support facilities. Oil and natural gas tank farms, mining complex are among suggested plans.

#### SOME BASIC FACTS ABOUT THE SEA

It might be well to begin this review of underwater technology by recalling some basic facts about the oceans. To start with, they are large, covering about 71% of the earth's surface, and deep, with a mean depth of 3,800 meters (compared with a mean land elevation of only 840 meters). At some points in the Marianas Trench in the Western Pacific, depths of almost 11 kilometers have been recorded. However, by far the biggest portion of the oceans reaches a depth of only 3 to 6 kilometers, and underwater exploration at present tends to concentrate on depths of less than 300 meters, which include all the continental shelves, and depths near 6 kilometers.

The oceans are also generally dark, although optical properties tend to vary considerably because of the presence of large quantities of tiny plants and animals, and rather chilly, with a uniform temperature of about 39°. Sea water is made up of about 86% oxygen, 10% hydrogen, 2% chlorine, 1% sodium, and minute quantities of magnesium, sulphur, calcium, potassium and seven other elements. The question of why the sea is salty is answered by the fact that today's best estimates indicate it contains approximately  $5 \times 10^{16}$  tons of salt.

One point everyone seems to forget about the oceans is that while we talk of this ocean or that ocean, there is really only one huge ocean on earth, and this ocean embraces every body of water found on maps which bears the name of ocean, sea, gulf, sound, bay or strait. All of these eventually meet in the body of water called the Antarctic Ocean, which actually has three branches—the Atlantic, Pacific and Indian Oceans—flowing Northward from the Antarctic Circle.

The engineer whose job it is to build the vehicles which will explore the ocean's depths, and to provide the scientist with the equipment and instruments he must have to learn more about them, inevitably goes to the scientist before he begins to build these vehicles and instruments in order to learn what the scientist already knows about the ocean environment. The answer, by and large, is, "not much," or at least not nearly enough or as much as he'd like to know. And those answers which science can provide only lead him to more difficult problems.

Dr. Spiess has explored some of these problems in a recent article. He notes, for example, that, while the surface of the sea has understandably been better explored than its depths, we still have a good deal to learn even about this relatively accessible area. For example, the complex phenomenon of surface waves is still imperfectly understood, and, although theoretical studies in this area are numerous, and reasonable predictions of the spectrum of vertical motion and the directional distribution of wave energy can be made, actual measurements

# the day you start here is the day we start helping you outgrow your job

The way we look at it (not only here at Electric Boat Division, but in General Dynamics as a whole)

good employees—properly placed, trained and motivated—are our fastest growing asset. So, right from the start, we'll be doing everything in our power to help you develop your full potential through a strongly-implemented management-sponsored program that makes your professional development a matter of planning, not chance.

This program, called "people development", is designed to spot your special capabilities—to help you move, to progress, even to change your product area or technical discipline if that's what it takes to increase the certainty of your success. Part of the program is a philosophy that charges each supervisor, whatever his level, with developing his own replacement. And our supervisors are adept at recognizing individual achievement and calling appropriate attention to it. Part of it, too, is one of the most extensive and far-sighted educational, study and post graduate pro-

grams ever offered by any company, to encourage continued academic proficiency. Hundreds of people in our Division participate each year.

But the thing that gives this approach of ours real point is the challenge and excitement of the field you'll be working in—Oceanology—a field as new as the Aerospace industry was new a dozen years ago, and as promising; a field that encompasses every means of undersea operation and exploration known to man.

And here, whether you're working on a deep diving research vehicle or an atomic sub, the opportunities for innovation (as well as growth for the innovative) are endless. For instance, every atomic submarine we build is treated as a new and different problem. Even ships in the same class differ since each succeeding one is, in fact, the state-of-the-art at the time we're building it. Within any sub, advances might

occur in nuclear shielding design; in heat transfer efficiency; in sound and vibration control; in new materials; in chemically based life support systems; or in a dozen other areas. And because of the close collaboration among men of many different technical disciplines, your thinking might spark a new idea in any one of them. Just as their thinking might spark yours.

Living and working in Groton, Connecticut is a rewarding experience in itself. For in this unique nautical community you are not only close to the men and women who build and sail submarines, but to all the abundant pleasures of the sea. (Not that you're far from more metropolitan pleasures if that's your preference.)

So, if you are earning a degree in engineering or science, and would like to know more about how we will help you outgrow job after job here at Electric Boat, make a date through your Placement Office to see our representative, or write for a new informative brochure to Mr. Donald K. Whynott.

## GENERAL DYNAMICS

### Electric Boat Division

Groton, Connecticut

An Equal Opportunity Employer • U.S. citizenship is required

of the directional spectrum in the open sea have been few and far between. In addition, we still know relatively little about such things as the conditions controlling heat transfer and evaporation.

Once we move below the surface of the sea, things get even more tacky. We may encounter such phenomena, for example, as internal waves—some with wave amplitudes of hundreds of feet—for which no adequate explanation is as yet available. However, Dr. Spiess points out the relative stability of this area (at least compared with the surface), and particularly of the deeper parts of the sea, has permitted fairly accurate measurements to be made of such quantities as density, pressure, sound velocity and index of refraction as functions of depth. All of these are known today to an accuracy of about 0.1% in most areas. In addition, measurements of absolute temperature, conductivity and salinity are today considered accurate to 1% or better.

One subject both the scientist and engineer would like to know a good deal more about is how the water flows horizontally. While the locations, general directions and approximate average speeds of sea currents are generally known, this information is usually available only as average numbers, and these may vary considerably in currents found at a particular time or in a particular place.

In general, it may be said that maximum current speed occurs close to the surface, with maximum speeds of 5 to 7 knots being found in the strong western boundary currents and lower speeds registered in the equatorial and eastern boundary currents.

The numerous plants and animals with which the sea abounds pose all sorts of problems both for the scientist and engineer. In addition to the damage large fish such as the shark or whale can

do, even the very tiniest organisms can increase drag on an undersea vehicle, clog water systems, foul lines and even destroy certain kinds of materials. These organisms also wreak havoc on systems which use sound or light sources for communication or detection purposes. Anyone who has ever listened to sonar underwater can tell you it's an acoustical bedlam.

When we reach the sea floor, we find another group of problems. For one thing, information about its topography is rather sketchy, and large portions of the sea floor have never been measured accurately, although acoustic techniques in use since the end of WW-II have given us a good deal of valuable information. Sampling of actual material from the sea floor, as Dr. Spiess indicates, is even more difficult, although new techniques give promise of obtaining deeper penetration. To date, only bottom photography has provided significant information on the detailed nature of the sea floor.

From what has been done, however, it appears that the sea floor is considerably more diverse than the sea itself, although within this diversity certain typical areas exist. Thus each ocean has its own ridges, plains, seamount regions and marginal deeps, as well as large areas of low relief.

The large-scale features of the sea floor are covered with sediment, thinly in some areas where flow from the continental shelves is diverted into trenches, and more thickly in others. While sediment core samples are numerous, it has not been until recently that measurements of the mechanical properties of sea-floor mud have been carried out. These have indicated that some areas are quite soft, with shear strengths as low as 10 psi, and that others, at slightly deeper levels, are in the 100 to 300 psi range.

The sea floor appears to be much harder on materials than the water above it. Bacteria and burrowing worms abound in its mud, and chemical reactions leading to decomposition of materials is more common and more rapid.

The equipment designer called upon to supply man with everything he needs to live beneath the surface of the sea for relatively long periods of time has some special problems, as well as some unique opportunities, because of the nature of the medium with which he is dealing. These problems, and opportunities, stem from the fact that the designer must learn to live with new kinds of constraints and new physical conditions. In some instances, he soon finds he may be able to turn what appear to be constraints into advantages.

Take pressure, for example. It is difficult enough and costly enough just to supply man

View of main deck of F. V. Hunt shows hydrophone cable running from cable tank through cable transport and over bow sheave. Cable is slack because a "hold" has been called momentarily during hydrophone emplacement. Man seated at left monitors cable for check-point markings. ITT Federal Laboratories is instrumenting the ocean floor for the weapons test range of the U.S. Navy's AUTEC complex.

WEAPONS RESEARCH AND ENGINEERING STATION  
NEWPORT, RHODE ISLAND**

An automatic, unattended oceanbottom seismograph station developed by the Geosciences department of Texas Instruments' Science Services division is moved into position for launching. Large ball at right is buoy used to mark location when the system is submerged.

with pressure-resistant housing for long voyages beneath the surface of the sea. To try to do the same for equipment which can be left unattended would be sheer folly. Consequently, the designer tends to put as much equipment as possible outside the manned cabin, which subjects it to ambient sea pressure which grows 0.45 psi for every foot it drops beneath the surface. Therefore, the designer learns little by little to build equipment that will function properly under a wide range of pressure variations.

Temperature is another factor which must be taken into account. Here, however, it is likely to work in the designer's favor in most instances, and particularly in the case of electronic equipment, since such equipment will experience relatively constant temperatures and the effects of an almost ideal heat sink.

On the other hand, the designer of acoustic equipment, as we have already noted, has some major problems, since his equipment depends on the propagation characteristics of the medium in which it is designed to operate. These characteristics can be affected even by relatively small temperature changes (one can go from the Equator to the Arctic Circle, for example, and experience changes of only about 55° in ambient sea temperatures), while diffraction effects can severely limit the operation of such equipment.

The medium itself represents further problems. Designers who have for years been working in air, which at atmospheric pressure is a dielectric, suddenly find themselves working in sea water, which is not only a very good conductor, but is also an electrolyte with about 50 dissolved elements in it. This means that even a small current leak could very quickly prove disastrous, and all electrical equipment must be ungrounded to prevent electrolytic action. Insulation must be designed not only to keep one conductor from touching another, but also to keep the water itself from touching the conductor. Corrosion and the effects of marine life are other worries. Finally, the medium's spectral characteristics are quite different from those of air, with even the lowest commercially used electromagnetic energy (30 kc/sec) attenuated 1 db every 30 cm. However, using acoustic energy, attenuation may vary from less than .01 db per mile to several hundred in the cycle and megacycle range.

The two fundamental things which are today hampering man's progress in conquering the sea are his inability to communicate with other men beneath the sea and with men on the surface, and his inability to see under water. These are the two major challenges which engineering faces as man strives to utilize space for his own benefit.

Communication beneath the surface of the sea is no easy matter. Since the attenuation of acoustic signals is far less than that of electrical energy, the underwater telephone would appear to be the best means of underwater communication. Unfortunately, even its range is rather limited, and subject to considerable variation with temperature. Furthermore, obtaining large quantities of data with the small bandwidths available in acoustic systems is no easy matter. Also, transit time is a problem, since sound moves through water at a speed of only 6,000 fps.

Seeing underwater also presents some major problems. Direct observation of the environment is limited because of the attenuation of light in water and backscatter due to particles. As a result, direct horizontal observation at depth ranges from zero to 200 feet, with maximum usable distance under perfect conditions estimated to be about 50 feet. While some work has already been done on electroacoustic imaging, a good deal more is required before man will actually be able to "see" underwater.

While the problems of this dense, opaque medium, with physical characteristics so startlingly different from those of air, at times appear insurmountable, progress is being made and will continue to be made as man begins to explore the sea's third dimension.

#### UNDERWATER VEHICLES

What kind of underwater research vessels do we need, and how will they be built? It is now clear that, despite the major effort the U.S. is making in this area, many problems still exist and it is likely to be some time before oceanographers are provided with a sufficient number of deep-diving submersibles to perform all the tasks they would like to carry out.

As Astronaut-Aquanaut Scott Carpenter has noted (in an address reprinted on page 50), the parallels between the underwater exploration program and the space program are striking. In both instances, for example, we find the use of both manned and unmanned vehicles; the requirement to live and work for long periods of time in a hostile environment; the development of closed-cycle type systems to meet this requirement; the birth of what is virtually a new and highly specialized industry to meet these vehicle and equipment needs, etc. . . . The aerospace industry is well aware of its capabilities in this area, and is already quite active. Official recognition of the need for the systems competence of developed by the aerospace firms is seen, for instance, in the selection of TRW Systems to integrate the entire ASW effort. In fact, it's now estimated that underwater technology will account for 10% of the industry's total sales by 1975, and it could conceivably be even sooner than that.

(See pages 30 and 31 for listing of vehicles.)

Some of these new vehicles are already in use; others will become operational in the near future. However, even our limited operations with these vehicles have revealed some major problem areas, weaknesses and requirements for new or improved equipment and instrumentation. Among these are the development of better means of communicating with surface ships or shore installations; improved navigation systems (since data gathered by a vehicle which does not know its position accurately cannot be correlated with a known position or course); more reliable sonar, which would permit vehicle mobility in dark or dirty water; and improved power systems, since long-duration missions today are largely power-limited.

The Navy has classified deep-diving research vehicles as follows:

Class I: Designed for use at depths up to 6,000 ft.

Class II: Designed for depths from 15,000 to 20,000 ft.

Class III: Designed for the deepest parts of the sea, i.e., operations at depths up to 36,000 ft.

It's interesting to note that 16% of the ocean bottom can be reached by a Class I vehicle (and also that this area roughly equals the surface of the moon). Class II vehicles can reach over 98% of the ocean floor and, in fact, 20,000 ft. seems to be a good goal for the ideal underwater research vehicle of the near future. At present, Class III vehicles are limited to what are basically deep-sea elevators of the *Trieste* type.

The Navy has described a deep-diving research vehicle as follows: "A manned self-propelled, untethered submersible, other than an operational combatant submarine, capable of operating with a reasonable degree of safety at depths of 6,000 ft. or greater, regardless of designed mission."

Present Class III vehicles all have basically a bathyscaphe design, which means they are awkward to handle and clumsy to operate. However, they are available and have done a lot of valuable work. These vehicles (the various U.S. Navy *Triestes* and the French Navy's *Archimede*) utilize lead-shot releasable weights to sink to desired depths, and then make minor depth adjustments by releasing a flotation material (usually liquid gasoline) or taking on small quantities of water ballast. Surfacing is attained by again dropping weights.

The Reynolds Aluminum/GD Electric Boat Div. *Aluminaut*, the U.S. Navy Bureau of Ships *Trident*, and the French Navy's *FRNS-3* are today's Class II vehicles. Of these, the *FRNS-3* is a bathyscaphe—the world's oldest—and has been replaced by the *Archimede*.

The *Aluminaut* represents the most advanced positively buoyant underwater research vehicle built to date. Because the 7079-T6 aluminum alloy used in its construction cannot be welded satisfactorily, it uses 11 cylindrical sections which are bolted together and capped at both ends by a hemispherical section bolted to form the pressure hull. The three-man crew, the motor and batteries, and many auxiliary components all ride within this hull.

*Trident*, when operational, will represent another step forward in that it will use a solid syntactic-foam material for buoyancy in place of the gasoline used in the bathyscaphe. The foam used in *Trident*, made up of tiny glass spheres suspended in a solid epoxy resin, has a density of 44 lb/cu. ft. and can withstand pressures up to 10,000 psi.

There are many more vehicles in Class I than in either of the other two Classes. Of the dozen or so vehicles in this category, however, only two—the Office of Naval Research/Litton Industries *Alvin* and the Westinghouse/Cousteau *Deepstar*—are true Class I vehicles in that they are designed to operate at depths of 6,000 ft. or more.

*Alvin*, designed specifically for oceanographic research, is particularly interesting because it is typical of the many underwater research vehicles which will be built during the next few years. Conservative in approach, its specifications were modest and considered well within the state of the art. To meet them, it was decided to build a spherical pressure hull for the crew and control instruments, with all major equipment and machinery outside this sphere for operation at ambient sea pressures. This dead weight was then compensated for by adding an inert buoyancy material.

The steering and propulsion system are inter-related, since both are provided by means of a single large stern screw which can be rotated 50° in either direction in the horizontal plane. The system makes the vehicle highly maneuverable. Two smaller propellers, separately controlled, can drive the vehicle up or down, or, by

varying or reversing thrust, can be used to steer it.

*Alvin's* versatility was demonstrated earlier this year when it was used to locate the "lost" U.S. H-bomb off the coast of Spain. Both *Alvin* and *Aluminaut* were used in the search for the bomb.

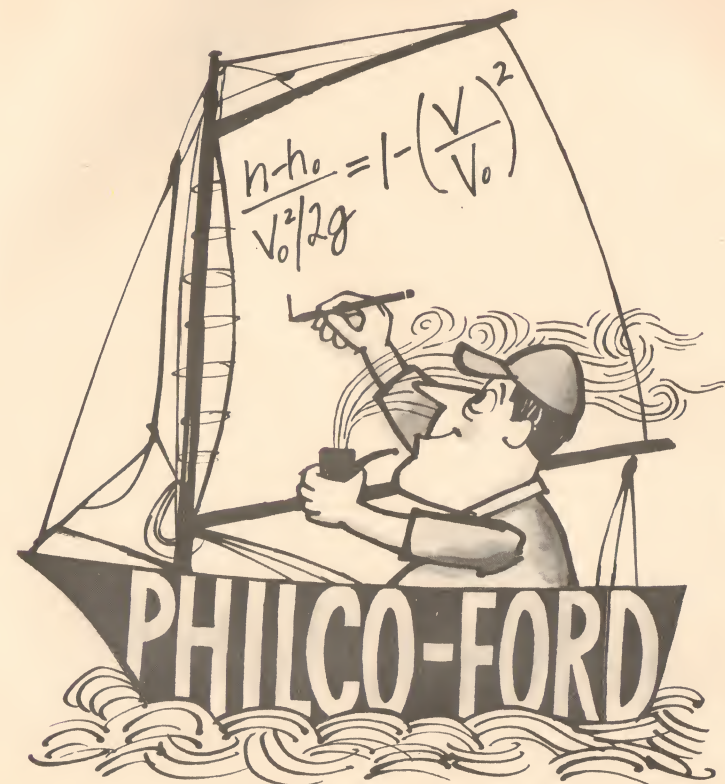

There are many other small vehicles capable of reaching depths from 600 to 3,000 ft. Most of these are smaller, less advanced vehicles than *Alvin*. Among them are such vehicles as the Westinghouse/Cousteau diving saucer, *Denise*; the Naval Ordnance Test Station's *Deep Jeep* and *Moray TV 1A*; Lear Siegler's *Benthos V*; the Pennsylvania University/Electric Boat *Ashera* (Star II); Electric Boat's *Star III*; the Perry *Cubmarine*; Helle's *Submanaut*, etc. Also worthy of mention are two larger Class I vehicles which are actually conventionally constructed sub-

Much of what man has bothered to learn about the ocean has been part of his efforts to exploit it militarily. Here Artist John Desaloff, of TRW Systems, which holds the systems integration contract for the nation's entire anti-submarine warfare program, depicts in abstraction the military use of the seas.

marines, the Swiss *Auguste Piccard* and the Navy Bureau of Ships *Dolphin*, now under construction.

There are three areas in which advances are required to substantially increase deep-diving capability. The first is development of a pressure vessel capable of going to greater depths with less weight. Use of a titanium structure in place of HY100 steel in *Alvin*, for example, could significantly increase its payload or depth. The second is development of a small, inexpensive energy source with a high power-to-weight ratio, capable of operating for extended periods at the ambient pressures of deep water. The third is

ENGINEERS AND SCIENTISTS:

## Sail Uncharted Seas With Philco-Ford

Philco is committed to advancing the state of almost every technical art—from engineering to manufacturing, from anti-weapons systems to underwater communications, from space age instrumentation to home air conditioning. Because we are accustomed to working in advance of everyone else, we don't always know exactly where our course may take us—except that it is forward. And we need bright, creative, ambitious people to help take us there.

Some other facts about Philco: We are a major subsidiary of Ford Motor Company. We are a company fast approaching \$1 billion in annual sales, to consumer, industrial and government markets. We offer stimulation, responsibility, and above all, a bright future.

If you are interested in a fast-paced, rewarding career with a fast growing major company, we'd like to talk to you. Watch for our visits this year to your campus. If you prefer, send us a brief note outlining your interests; we will send you specific information about suitable openings available.

Address: College Relations, Dept. EO, Philco-Ford Corporation, C & Tioga Sts., Philadelphia, Pa. 19134.

- TECHNICIANS

## why?

Challenging work which offers ample opportunity for professional growth is characteristic of the Quality Evaluation Laboratory. By applying your technical capabilities to the Laboratory's assignments you can make a significant contribution to the national defense. Employees are encouraged to continue their professional studies at the University of Hawaii. Trips are made by personnel to continental United States to confer with their counterparts in many areas. Engineers, scientists, statisticians and others participate in high level conferences and briefings. As weaponry development proceeds, interesting new channels of investigation are opening. On-station training in such subjects as non-destructive testing, engineering reliability and shock and vibration, taught by specialists, is conducted. Federal employees in Hawaii are currently (1966) paid a 15% cost of living allowance which, although subject to change, is Federal tax exempt.

a water- and pressure-resistant buoyancy material which is lightweight and inert.

Solving these problems would go a long way toward supplying man with a truly satisfactory deep-diving research vehicle. They pose a considerable challenge to the nation's engineering community.

The materials problem is a particularly interesting one. Fiberglass, plastics and concrete are under investigation for lightly stressed enclosures capable of operating at ambient pressures. In fact, Edwin Link designed a 600-ft.-depth manned enclosure consisting of a base frame and a cover made of rubber-covered cord similar to that in an auto tire. The frame in this design could have been made of reinforced concrete, and using moldable or laid up materials would be considerably less expensive than using conventional means of submarine hull fabrication.

### ARTIFICIAL "GILLS"

Life-support systems of greater efficiency are also required in these vehicles. Recently, interest has grown in using the dissolved oxygen in the sea as fish do. Some form of artificial gill might well reduce the amount of resupply materials such as oxygen, lithium hydroxide, or other absorbents now required. Engines operated on recovered oxygen might even make the use of fossil fuels more attractive than nuclear power when costs, operational hazards and operational complexity are taken into account.

Another interesting program worth noting is the Navy's Deep Submergence Systems Project, for which the Office of Naval Material has overall responsibility and the Nortronics Division of Northrop Corp. is the industrial coordinator. Established in June, 1964, the program is designed to provide a means for deep-water search, rescue and salvage operations. Three vehicle types are being projected, one to be used for rescue and two for search at different depths. All of the vehicles will be built on the sphere principle, and initially 40 Navy submarines will be equipped to carry the rescue vehicle, a prototype of which should be in the water late next year. The two search vehicles, development of which will follow the rescue vehicle, will be capable of operating at depths to 6,000 and 20,000 ft. respectively.

Parallel with the vehicle development portion of the project is the Man-in-the-Sea program, marked by the highly successful Sealab I and II experiment.

Sealab II was of particular significance since it provided some vital data on man's ability to live beneath the surface of the sea for long periods of time. In summing up the results of the Sealab II experiments, which ran from Aug. 28 to Oct. 12, 1965, a Navy spokesman noted that over 10,000 man-hours had been spent at 200-ft. depth, while over 500 man-hours of experience had been gained in swimming and working at depth.

*"No man possesses a genius so commanding that he can attain eminence, unless a subject suited to his talents should present itself, and an opportunity occur for their development."—Pliny.*

Against a panorama of severe technical challenge, Lockheed has mounted one of the largest and broadest R&D programs in the country. Lockheed's far-reaching land, ocean and space R&D activities present abundant long-term opportunities against which to match your talents and interests. R&D programs that include: Advanced technology satellites, bioastronautics, cryogenics, advanced concepts of re-entry, advanced materials, lunar roving vehicles and shelters, manned and unmanned exploration of distant planets, and recoverable boosters. Unique land vehicles, intrusion detection, natural

resources systems, state and hospital information systems, microparticles, underground nuclear tests, command systems for the military services, new concepts in tactical missiles. Deep Submersible Rescue Vehicles, underwater imaging systems, advanced materials, commercial development of the ocean bottom. If you feel that you can contribute to one of these vital programs, please write: College Relations Manager, P.O. Box 504, Sunnyvale, California. Or you may call collect (408) 743-2200. Lockheed is an equal opportunity employer.

**LOCKHEED**  
MISSILES & SPACE COMPANY  
A GROUP DIVISION OF LOCKHEED AIRCRAFT CORPORATION

From this experience, he pointed out, we had learned that:

1. Reasonably large groups of men can live for protracted periods (15 to 30 days) at 205 ft., have a large degree of autonomy, accomplish useful work, be safely decompressed, and show no apparent serious adverse physiological or psychological effects.
2. The Navy's first experience with no-decompression excursion dives from a starting depth of 205 ft. in a saturated state to a depth of 266 and 300 ft., were successful. This represents an important addition to undersea diving technology.
3. There is a clear degree of diver adaptation to cold water as shown by interviews with the Aquanauts and by pre- and post-cold water emersion physiological measurements.
4. Adequate protection against cold water can be obtained for extended periods by the use of heated suits. Swimmers without supplementally heated suits are limited to less than 1 hour of useful work in 47-54° F. waters.
5. A degradation of work capability varying between 17 and 37% as compared with warm or shallow water capability occurs as the result of a multiplicity of environmental and psychological stress factors.
6. Improved tools and techniques show

promise for salvage and other undersea work functions.

7. Based on the analysis of the overall performance of the Aquanauts, criteria can be developed for the selection of future Aquanauts.
8. The interaction between man and porpoise has shown that, to depths of 200 ft., the porpoise can be extremely useful to man-in-the-sea operations.
9. In-situ living offers a new and important methodology to scientific, biological geological ocean floor investigations.
10. Although vastly improved over Sealab I, the habitat and much of the diving equipment are still rudimentary and require extensive development to facilitate routine operations.
11. Deep-water swimmer communications and ocean-floor navigation systems require an immediate effort aimed at producing acceptable equipment for future man-in-the-sea operations.
12. A completely autonomous habitat awaits the development of reliable underwater power package and integrated complete life-support systems.

#### HARVESTING THE SEA

While the ocean yields millions of tons of fish each year, and the fish catch is increasing at the rate of about 8% by weight annually, it is

#### How about a Real Career?

We promise what we can deliver: a chance to work on some of the most exciting and rewarding large-scale military systems now underway and a wide range of important military and commercial products and subsystems.

We are the Data Systems Division of Litton Industries. We designed and developed the highly mobile MTDS (Marine Tactical Data System) and the ATDS (Navy Airborne Tactical Data System) for the E2A aircraft. We also think small. Such advanced prod-

ucts as our L-300 microelectronic computer and our line of micro-miniaturized power supplies (slightly larger than a pack of king-sized cigarettes) were developed to fully realize the high reliability, small size, and low power and weight potentials of microelectronic systems.

If you would like a real career in COMMAND AND CONTROL SYSTEMS, DATA PROCESSING AND DISPLAY SYSTEMS, SPACE INFORMATION AND SURVEILLANCE SYSTEMS and related equip-

ment, we invite you to apply at the Data Systems Division of Litton Industries. A B.S. degree in Engineering, Mathematics, or Physics is required. A wide range of junior, intermediate and advanced positions is available. SEND YOUR RESUME TO MR. O. ROGERS, 15800 STRATHERN STREET, VAN NUYS, CALIFORNIA. OR CALL MR. ROGERS AT 781-8211.

### NAVAL SHIP ENGINEERING CENTER PHILADELPHIA DIVISION

for

Mechanical Engineers	Chemists
Marine Engineers	Metallurgists
Electrical Engineers	Welding Engineers
Electronic Engineers	Control Systems Engineers

The Philadelphia Division of the Naval Ship Engineering Center conducts research, exploratory development, and testing of propulsion and auxiliary machinery prior to introduction into the Fleet, and provides maintenance engineering, including inspection and repair assistance. Radiographic results are provided on non-nuclear material. Standards and procedures are established for quality submarine antenna systems. Installation, training, maintenance, and quality assurance programs are developed. Development and application of dependability engineering and value engineering are also conducted.

One of the most attractive considerations in working for the United States Government is the challenge offered by being associated with the latest engineering and scientific discoveries. The fringe benefits, including educational tuition, are exceedingly attractive.

Historic Philadelphia offers numerous educational and cultural advantages. For vacation or weekend pleasures, it is ideally situated for driving to the mountains or beaches.

For more information write to:

Mr. James H. Kopp  
Code 6711D  
Naval Ship Engineering Center  
Philadelphia Division  
Philadelphia, Pa. 19112

estimated that the catch could be increased ten-fold without seriously affecting the total fish population. Meanwhile, commercial fishing craft and fishing gear grow more sophisticated and efficient, particularly in the use of modern electronics for locating large schools of fish.

It is interesting to note in this connection that some of the most advanced foreign fishing fleets, and notably that of the U.S.S.R., operate very effectively over the continental shelves of both coasts of North America. In fact, foreign fleets take almost as much fish from fishing grounds under U.S. jurisdiction as do our own fleets. In other words, this is an area in which we still have some catching up to do.

Continuing improvements in catching and processing fish will be required to fully utilize the fish supply available in the world's oceans. And the supply must inevitably be used, since fish represent an excellent source of food for many protein-deficient nations. Moreover, fish meal and fish-protein concentrate appear to constitute an economical and convenient form of sea food.

These improvements will include developments in sonar, TV, and more efficient net control, as well as investigations of fish habitats and origins. Experiments in fish farming are already under way in Japan, Russia, and these may prove to be an extremely important area of research. Experiments to date have been inconclusive, primarily because so little is known about proper environmental conditions.

#### THE SEARCH FOR MINING METHODS

Another area of major interest today is mining the ocean's minerals. The first cautious steps in this direction have already been taken, but the future possibilities are at this point almost incalculable. Certainly mining and oil drilling in the ocean floor constitute a new industry with enormous growth potential.

The infant industry is already spawning many special new vehicles, as well as applications for existing vehicles. Mobile catamaran rigs have been used for some time in offshore oil drilling in deep water and a goodly portion of the continental shelves can be worked from large fixed platforms mounted on long, stilt-like legs. Installations of this type are supported by a variety of small craft and larger vessels, including hydrofoils, used for transferring personnel and light equipment.

The limited amount of ocean mining which is carried out today usually employs conventional hydraulic dredges, of the type used to deepen harbor channels. However, recent years have seen the development of the so-called air lift, which gives promise of playing an important role in extracting minerals from the ocean floor in the future. In the lift, air bubbles are inserted in the lower end of a pipe and thus give the water a high flow rate. Mining systems employing

(Continued on page 64)

In as good a spot as you are today?

Well-informed? Up on things? Intimately acquainted with the state of the art in your field of study?

Or will you (through no fault of your own) be dangerously close to the brink of obsolescence?

Could happen. Often does. Which is one good reason to consider a career at MITRE.

MITRE is pioneering in the design and engineering of complex information, sensor, command, control and communications systems for the United States Government. Our assignments include such prominent electronic systems as the NORAD Combat Operations Center, the Back-up Interceptor Command System for SAGE, and the National Military Command System (NMCS).

These projects represent the most important systems challenges of our time, and require the most advanced thinking on a broad range of scientific problems and the technologies needed to solve them.

As a member of the MITRE team, you'll be working in an atmosphere of scientific inquiry, alongside colleagues of outstanding reputation, with the opportunity to make an original contribution

Minimum requirements: B.S., M.S. or Ph.D. in electronics, mathematics or physics. Write to L. J. Glinos, College Relations Coordinator, The MITRE Corporation, Box 208AV, Bedford, Massachusetts.

MITRE also maintains facilities in Washington, D. C., and Colorado Springs, Colorado, Tampa and Patrick A.F.B., Florida, Atlantic City, New Jersey, Houston, Texas and overseas in Paris and Tokyo.

An independent non-profit corporation, MITRE is technical advisor and systems engineer for the Electronic Systems Division of the Air Force Systems Command, and also serves the Department of Defense and the Federal Aviation Agency.

to your area of interest.

In an environment like this, there's no telling how far you can go. But this much is certain. You'll not be overlooked, and you can't be overtaken.

Salary? Benefits? They're competitive, of course. Moreover, we have an excellent

Educational Assistance and Staff Scholar Program. (Many MITRE

employees presently attend nearby educational institutions including

Harvard, Boston University, Boston College, Brandeis, Northeastern, MIT, and Tufts.) Depending on your interests,

qualifications and current openings, you may start in one of the following,

or other, departments:

System Planning and Engineering

Air and Missile Defense Systems

System Design

Systems Analysis

Air Traffic Systems

Tactical Systems

Strategic Systems

Commander M. Scott Carpenter who has experienced a wider variety of hostile environments than any man alive contrasts the superlative back-up of astronauts with the "mail-order" equipment afforded what he calls . . .

## the exploration of "inner space"

### A NEWLY-LEGITIMIZED CHILD

■ There is a small but expanding group which believes that it is imperative for the U. S. Navy to develop a broad capability for exploiting the ocean floor. There is a larger group which believes it is mandatory for this nation to explore the outer reaches of space.

I belong to both, and my experience with the two assault groups dedicated to these credos allows me to make same comparisons and draw some exclusions which are pertinent to the safe, expedient, and successful conduct of our Man-in-the-Sea Program.

The comparisons reveal, among other things, some similarities in the two endeavors, and there are more of these than the casual observer might realize. For example, we face many of the same problems in:

1. Design and fabrication of the machines, and particularly of the environmental control systems.
2. Selection and training of the crews.
3. Suit design, manufacture, and fitting.
4. Physiological and psychological studies conducted before, during, and after the experiments. These are becoming more and more important as we approach prolonged mission times.

Both must design and test hardware, and select, train, and test men, specifically for operation and use in a foreign environment. We share a common need to search for new materials and new techniques.

We both need a vast array of talent and equipment not only to do the job but also to carry on the research which is a prerequisite.

Both pit man against danger, confront him with unknowns, and both say "no" to the physical barriers that we face. Both will ultimately enrich our life on this planet.

After the first Mercury flights, the recurring question was, "What was it really like?" And we answered a thousand times. "It was great, beautiful, exhilarating, a hell of a thrill." The truthful answer is that we got up in the morning and went to work. That may be a slight oversimplification, but we were so well trained that that is what it amounted to.

Now, after the Sealab operation, the question most frequently asked of me is, "Which is more exciting, more hazardous—better? Check one."

A comparison is possible; a choice is not. There is no need to pit man in space against man

in the sea. One is a superbly sophisticated, glamorous effort, and its impact has set this country on its next hundred years course. It ranks currently between God and motherhood. The other is a newly-legitimized child represented by a nucleus of 50 dedicated men working with mail-order equipment, in marginal conditions, using outmoded techniques.

Now, when I tell you we got up in the morning in Sealab and went to work, you'd better believe it. I have never worked as hard or as long, but on the other hand, never has there been for me as much personal satisfaction as there was during the entire Sealab operation. We know we were doing a good job and there was a mood of cheerfulness and willingness to work that made everyone give his best.

A lot of this has to do with the fact that divers are a very special breed. The profession calls for more guts and motivation than any other I know. I wanted to say to them, "You're magnificent, I respect and admire you, I'm proud to be one of you." But I figured only Gregory Peck would do that.

Let me tell you what one day in an aquanaut's life is like. First, forget all you've seen of Lloyd Bridges' underwater world. Sealab waters are not like that. They are dark, and dirty, and cold. We don't relish these conditions but we realize that most of the waters of the world are not warm, clear, and inviting. And we know that these are the surroundings to which man must adapt himself and his equipment if he is to prove he can live and work in the sea.

Preparation for a dive is a lengthy process. To don the easily torn, sponge-rubber, wet suit, the knife, the watch, compass, depth gage, weight belt, helmet, face mask, flippers, and breathing apparatus requires perhaps 45 min. More time is required to assemble the tools and equipment the diver will use. Still more is required for a last-minute recap of the dive plan.

The waters in which the Sealab team operated must have been in a different ocean from that in which Lloyd Bridges dives, Cmdr. Carpenter thinks; "they are dark and dirty and cold . . . not warm and clear and inviting." Artist John Desaloff of TRW Systems captures the frigid green of the 300-ft. depths in his painting opposite. E/O gratefully acknowledges the cooperation of the Publications Dept. of the American Institute of Aeronautics and Astronautics in providing many of the photos used in these articles on underwater technology.

It is necessary to do all this because, as soon as a diver and his buddy—both intelligent, cooperating, communicative human beings—step through that hatch and enter the water world, they become mute and essentially deaf. Their vocabularies are reduced to less than a dozen words, spoken only with raised fingers or the rap of a knife hilt against a gas bottle. A diver's most urgent cry—Mayday—can be uttered only with four fingers or four raps of a knife hilt against a gas bottle, and the raps don't carry very far.

*We desperately need a research program dedicated to the development of a reliable diver-to-diver communication system that does not encumber him with wires and does not compromise the performance of his breathing apparatus.*

The divers will spend their first 10-15 min. in the water working against the clock on delicate assembly tasks and intricate two-hand coordination tests. These, as well as measures of whole body strength, are done pre- and post-dive, in the water, in an attempt to measure the degradation of man's performance during long exposure to cold water.

Once these tests have been accomplished, they can get on with their work. This can consist of any number of tasks related to the ocean sciences, salvage, rescue, marine biology, geology,

Pointing up the difference in the support accorded the astronaut and the aquanaut, Cmdr. Carpenter is seen (above) ready for the elevator ride to the MA-7 spacecraft, against a background indicative of the almost unlimited financial and technological support his space trip enjoyed. Below: Ken Condit and Wally Ross work out in the training tank with one of the principal "assistants" backing up the Sealab-II crew—a trained white-sided Atlantic porpoise!

sound and light propagation, installation of marine weather instrumentation, logistics and maintenance of underwater equipment.

By and large, this work is done with ordinary tools that can be found in any mechanic's tool box and with equipment that works well on dry land but invariably develops some ailment after immersion in salt water. We need to devote more human engineering talent to the development of special equipment and tools for use in this dim, weightless, corrosive world.

If the diver's work carries him into water much deeper than his habitat, his suit is compressed by the increased pressure until it becomes paper-thin and loses nearly all its thermal-insulation properties, and he gets cold faster. I have seen men shudder with an amplitude of 4 in. from the cold. It isn't painful; sometimes it's even funny and we laugh and shiver together, but a man's ability to do useful work under these conditions is severely degraded.

We need to develop a suit that does not tear easily as it does now, but still provides a good thermal barrier, regardless of depth. We need to develop a reliable, thermostatically controlled, electrically heated suit, and ultimately we need to develop and adapt the liquid-cooled Apollo suit to our use. The liquid flowing through the

## There's no ceiling on this classroom. Or on engineering careers either.

We've set up our development program to move you along as fast as possible . . . with the entire Eastern Test Range for your classroom. It's only 9 months long and stresses on-the-job training. It is highly individual and as there's a lot of technology to assimilate in a short time, we've kept classroom learning to a minimum. We've found from past experience that what you learn in the classroom (broad theory in such areas as tracking, and celestial mechanics) is easier to absorb if you see it in action.

There's a lot of action to witness. And you'll have some of the nation's top range pros on our technical staff to guide you through instrumentation systems such as trajectory measurements; telemetry; communications; data display, transmission, processing and analysis; command and control; and timing synchronization.

It won't be long before you're a Range Pro—an all-around creative engineer responsible for the successful coordination of the thousands of details that go into supporting the

country's major and minor space launches.

For more information, see your Placement Director, or write to Manager of College Relations, Dept. 96B, Guided Missiles Range Division, Pan American World Airways, Inc., 750 S. Orlando Ave., Cocoa Beach, Florida. An Equal Opportunity Employer, M&F.

PAN AMERICAN WORLD AIRWAYS, INC.

## Going to start a job or a career?

There are plenty of "jobs" around. But if you are seriously interested in beginning a long, rewarding career, it will pay you to give thorough evaluation to Hamilton Standard as your employer. Hamilton Standard is the oldest and most diversified division of United Aircraft Corporation, and we know that continued growth is dependent upon men with bold ideas, sound backgrounds and vital creative urges. If you've got what it takes (and you're the one who knows), this will be important to you.

Wide product line for stability, stimulus. Challenge and opportunity are sustained by over 200 product programs being active at any given time! Departmental categories include: spacecraft environmental control systems; ground support equipment; precision jet aircraft equipment; electron beam machines; a wide variety of electronics activity; overhaul and repair programs.

Desirable fields of specialization for BS and MS candidates include:

Aeronautical	Industrial/Value
Chemical	Mechanical
Electrical/Electronics	Metallurgy/Metallurgical
Engineering Mechanics	Physics
Engineering Science	BioEngineering

Get complete details about our highly successful training and orientation programs that fit you right into our team. And see for yourself why we feel we offer one of America's most desirable living areas—beautiful Connecticut countryside. Check with your College Placement Office to schedule an interview with our representative when we visit your campus, or

garment could be heated with a small radioisotope package replacing one weight on a diver's belt.

The astronaut's EVA chest pack and the diver's breathing apparatus are a study in contrasts. The chest pack is a beautifully designed, compact, miniaturized unit. The best of this country's talent went into its construction. The diver's lung, on the other hand, is an 84-lb albatross around his neck.

Monitoring the satisfactory performance of the lung currently in use is purely subjective, is done mainly by the diver's companion, and is limited to watching whether bubbles are coming from the right place or the wrong place. It is both difficult and time-consuming to set up the control element properly. It gets out of calibration easily, and is not as reliable as it can be made. It has many design defects and reflects very little of the tremendous advances recently made in the field of human engineering that are so evident in aircraft spacecraft, and space-age personal equipment.

*The astronaut in flight faces a splendid panel of instruments which provides immediate and continuous evaluation of all the components and systems upon which his security depends. In addition, he has three shifts of eyes and ears around the world helping him, through telemetry, to check his equipment. The diver, in contrast, has little or no instrumentation in or out of his habitat. And, when he is in the water, he is alone. He and his companion are completely beyond the help of any man.*

We do have some safeguards. For instance, a man can help his buddy get back home with an extra mouthpiece on his own equipment, but the need to give the diver better equipment, more instrumentation, and longer and deeper excursion times still exists.

Our most imaginative thought must focus on the design of the habitat and the whole concept of undersea living. Man must be able to sever his psychological, as well as his physical, ties to the surface. Adaptation of nuclear power would give us a completely autonomous, self-propelled research vehicle. It would avoid the many problems we face when we try to handle a sub-surface object with a surface vessel, and it would open up unprecedented depth and endurance capabilities.

The Sealab II habitat was luxurious in many respects, with larger portholes and wall-to-wall carpeting, but we are not served well by a cylindrical design. We need more room in the diving station; this was our worst bottleneck. We need telescoping legs to help us level it on uneven terrain, and separate laboratory areas away from traffic and we need cryogenic oxygen storage.

Meanwhile—back to the aquanaut. He re-enters his topside world not in a 15-min. blaze, but by purging his body slowly, and sometimes painfully, in a decompression chamber. A man remaining at 650 ft. must wait six days to step outside the chamber. In Houston, we have the

## rough and tough!

Got a taste for "rough and tough" design? Things that go? Like high pay, and great living? A job where you can learn a lot, fast? That is high priority defense work? And always presents fresh problems to crack? Then let's talk!

You're our kind of person, if you've always liked motors that run, machines that are built to take it, and things that "go." And if you don't mind a "go" situation for yourself, financially and professionally speaking. If you're pretty keen for hunting, fishing and such, in addition... maybe we ought to talk?

FMC Ordnance is a Division (founded in 1951 and now far larger and still growing) of one of America's top 60 companies, one that's aggressive, innovative, highly diversified, fast growing. We make tracked, wheeled and amphibious vehicles, mostly for our armed forces, and for friendly countries. A good field — there is always fresh demand, always new types and adaptations to be developed. Great spot for a young person to get a lot of valuable experience, fast. No waiting for "consumer trends" or "the market." Stimulating. Demanding. And pays very well.

Then there's our location, in the rather fabulous Kanawha Valley, a prosperous industrial area right in the midst of equally fabulous West Virginia mountains. Live in the Charleston metropolitan center, with a quarter-million population, yet free of usual big-city problems; and with concentration of professional and technical people. Morris Harvey College, West Virginia State, and West Virginia Institute of Technology are all close by for advanced study. Look into a career with us. Interviews at our expense will be arranged.

Besides excellent salaries, we offer a complete benefits program. Relocation expenses reimbursed. U.S. citizenship is required. Please write us, and we'll send more information, or send resume. Address: Mr. R. G. Evans, Dept. EO 2/67

Free World's largest altitude chamber, capable of accepting the entire Lunar Excursion Module, Command Module, and Service Module.

For undersea work, we have a scattering of small pressure chambers around the country. One goes to 800 ft. We need a 200-ft. capability now, with a large, water-filled compartment which will allow us to evaluate the immersible equipment. It must be capable of being pressurized with helium, argon, or other rare gases as the need arises, and in it we need to study the effects on man of very high pressures.

Does he slow down, become sluggish? What cellular changes occur? How are his organic functions altered? A marriage of cellular chemistry and definitive physiological and psychological studies, which is so badly needed, could center around a deep-submergence center with a high-pressure facility such as this. Accurate measure of caloric intake and metabolic rates could be made and valuable data gained by men interested in hyperbaric medicine.

Perhaps the chamber's most important use would be in the study of inert gas uptake and elimination by the human body. We must have a better understanding of this before we really begin to understand the decompression and narcosis problems you've heard so much about.

I'm convinced that the press and TV sold the space program to the world. One of my chief regrets is that we could not bring back better photographic documentation from Sealab, but the light level and visibility just didn't permit it. These pictures would have been of great value in attracting more support and more young, intelligent, hard-driving men into our group of 50.

The disparity between the equipment used by aviators and divers is incredible, but pilots are a very powerful group, irritatingly so at times. Nevertheless, the have complained and fought for and gained the innovations and safety precautions that the undersea program needs now to move out of the "Gee whiz, we did it" stage.

*I know the talent is out there. I know there are men looking for a field to which they can commit their lives.*

In addition to our concrete list of needs, there is something else, something intangible that is worthy of mention. I think it narrows down to a basic feeling among the participants in these modern sustained experiments that we want more than just to remain alive. Our cry is "Make it better, make it last longer, make it easier to operate." After the feeble beginnings of pushing body and mind, and figuring out a way to beat the odds, we *always* want more.

An airplane that bears this nation's emblem, a spacecraft that carries the colors of our country around the globe, and a United States research vessel embarking on a mission in the depths of the world's oceans—all must be stamped superb.

*The resources and men to make them so are available. We can be content only if we bring the best to coming operations.*

# Ten reasons She will want you to take a job at **MCDONNELL**

**1.** McDonnell is a "name" in aerospace... a name earned by solid engineering achievement in the current decade. The engineering leadership exemplified by successes in Gemini Spacecraft and the Phantom Fighters lifts your career and shoves it toward success.

**2.** Stability and security sometimes seem unimportant to young engineers just starting a career. But they are essential and you would be unwise to ignore them. McDonnell has never had a major decline in engineering and professional employment. The Company has grown rapidly in every one of its product areas. It presently has a backlog of more than a billion dollars in production contracts, and yet research is one of the fastest growing activities in the Company.

**3.** St. Louis is America's "City on the Go". In civic progress, in entertainment, in stores and homes, in industry, in sports and recreation, in education, in construction, in human involvement, St. Louis is the city with a "future" in the center of America.

**4.** You can best "change the world" by living in a world of change. The climate of St. Louis offers the mental and physical stimulation of four distinct seasons. How can you enjoy a warm fire without a new snowfall for comparison? What other natural phenomena than spring brings such a lift to your spirits? Who has failed to enjoy the comfort of a summer morning or the crisp smell of an autumn afternoon?

**5.** McDonnell's suburban location allows you to choose from the total spectrum of living locations. You may like the pace of apartment life at the heart of this 2½ million person metropolis. Or you might like the nearby suburbs with small city atmosphere and tree-lined streets. Just as convenient are rural areas, where you can live apart from the hustle yet be close enough to enjoy city-living advantages.

**6.** Naturally you want to earn your way and you want all you can earn. McDonnell wages are competitive with that of other industries. But being competitive isn't enough after you begin to show your mettle. Then, it is corporate policy to recognize the unique and individual efforts of those who strive for and achieve engineering excellence. Success will stem from a combination of inspiration and perspiration... probably 10% of the former and 90% of the latter. But if you're willing to work, you'll never need to worry about your economic and organizational progress at McDonnell.

**7.** Facilities at McDonnell are second to none in space, advanced aircraft and automation. You'll find organizational and physical working conditions that complement your skills and education. McDonnell testing and development facilities range from man-rated space chambers to Mach 28 wind tunnels, laboratories from microbiology to optics, computers from analog through hybrid to digital. You will find McDonnell is a team organization and nowhere is teamwork as essential as in the aerospace industry. Team organizations keep you from becoming a desk-bound engineer and stimulate the exchange of experience and knowledge so necessary to the development of wisdom.

**8.** The Gateway to Space is in St. Louis. You'll be working with the experienced men at McDonnell who designed the aircraft and spacecraft that have, for a decade, dominated aerospace technology. McDonnell is strongly oriented toward government contracting. It has demonstrated the talent that provides exceptional national service while returning worthwhile earnings to investors. As the fastest growing segment of our national economy, the Government provides a stable and continuing marketplace for those companies whose organization is oriented toward effectively serving the Nation's needs.

**9.** You may feel you've had enough education, but you'll soon decide to seek more. The McDonnell College Study Plan encourages self development and offers economic assistance plus adjusted work week benefits for advanced degree studies directly related to your job responsibilities. Many private and public colleges and universities in the area offer applicable programs.

**10.** Nowhere in industry can a young engineer find more job satisfaction than in contributing to national advancements in air and space. At McDonnell, pride in workmanship is a habit nurtured by the national acclaim that is the reward for success.

## SYSTEMS MANAGEMENT IN AEROSPACE

Astronaut preparing to erect S-Band antenna on lunar surface for TV transmission to earth. Artist rendering by Craig Kavafes, GAEC.

### ... A Grumman Challenge

■ Before we turn the corner and step into 1970 it is likely that the United States will have placed a man on the moon and returned him to earth. When that event takes place it will eclipse in scope all engineering accomplishments of the past.

As of the moment, this gigantic project, called Apollo, will cost the U.S. about \$20-billion and will involve the highly demanding and coordinated efforts of roughly 5,000 industrial firms and 300,000 scientists, engineers, and technicians. But numbers alone cannot tell the story; they rarely can. Accomplishments that today lay at our doorstep must be related to the sweep of recent history if they are to be placed in perspective.

For example, it was just 36 years ago that the fledgling Grumman Aircraft Engineering Corporation, with six directors and 15 employees, fulfilled its first contract, the delivery of two amphibious aircraft pontoons. It was a modest beginning, but within three years Grumman had built its first bi-wing fighter plane and was thinking of expansion and diversification. Business grew steadily. Then the Second World War hit. Employment leaped. So did production: Some 17,000 planes were produced during the war, a feat that earned five production awards from the Navy, a Presidential Medal of Merit for Board Chairman Roy Grumman.

Those 17,000 planes, of course, weren't built by the original 15 employees who had turned

out the two pontoons a few years earlier. But, even as employment burgeoned, the firm retained the small, family type atmosphere that still marks it as "a good place to work."

New management techniques were on the way, however, occasioned by the changing nature of the firm's undertakings. Suddenly there was a new scientific and industrial environment in which to operate.

New techniques and devices sprung up: electronically controlled communications systems, supersonic aircraft, missiles, radar, sonar, cryogenics, microminiaturization, lasers, thermonuclear weapons, rocketry, and a host of others. They came not slowly or warily. They came as though impelled to overturn patterns of the past—with one sizzling streak of lightning.

An unmanageable flood of scientific data resulted. No one man had even the slightest chance of comprehending, much less directing, the stream of knowledge.

The era of specialization and sophistication was here.

New techniques of operation and management had to be created. Specialists were drilling deeper and deeper into knowledge, but there was a real danger that they would become insensitive to specialties not directly related to their own. A multiplicity of highly specialized disciplines scattered about without regard to analysis of their interrelationships was nonsensical: maximum thrust of knowledge could be

As a vehicle, the Lunar Module looks an unlikely candidate to carry one person to the corner drugstore. Within a couple of years, however, it will carry two men to the surface of the moon. The LM folds snugly into a flared fairing on the bottom (at launch) of the Apollo capsule. In orbit about the moon, two men will leave Apollo to enter the LM and descend to the lunar surface.

achieved only by close communications and organization plus firm management direction. The way to get that thrust is to adopt systems engineering, which, in its simplest form, means to plan and divide work in such a way that a desired objective is reached with a minimum of time and energy.

Grumman's work in designing and fabricating the Lunar Module, the Apollo vehicle that will land men on the moon, is a good example of the concept of systems engineering in practice. In essence the problem was how to produce a module that would be capable of carrying two men to the moon's surface and back to an orbiting Command Module.

The spade work began with a concept, an idea of what would be necessary. It came in the form of a Grumman interoffice memo in 1958—a full four years before companies were asked to compete for the contract by the National Aeronautics and Space Administration. In other words, work was begun at Grumman before most people were considering such a scheme. That foresight, and the willingness to commit \$4-million worth of engineering dollars to an idea yet unproved—that calculated risk—later paid off. When the Government pressed for faster action in the space race in 1961, the Company *already had in hand* an exhaustive study of what is now labeled the Lunar Module.

The first step in the formulation of that study was to define the overall mission: to get a man on the moon and return him to earth. Then this broad mission was dissected and broken down into concrete and manageable segments. These elements are called systems which are complexes of functions that may or may not include equipment and machinery. In any event, these elements are the basic units of systems engineering.

The management task is then to organize all of the pieces of the engineering puzzle into a coherent whole so as to accomplish the total mission. This management structure, if one were to view it as an isometric drawing, would be a pyramid. At the top, in the case of the LM, is a vice president. Immediately below is a program manager and an engineering manager, each of whom has administrative staff to assist him. As the chart fans out there are 9 program managers whose job is to oversee, direct, and control operations of the engineering and technical staffs in their broad functional areas. And the further down the line one goes, the more technical and specialized the work becomes, and, therefore, the broader the base of the pyramid.

All of these defined, specialized areas are systems shaped to solve the puzzling engineering and technical questions within their jurisdiction. For example, one system dealt with the human factors involved in matching equipment to the men using it; another dealt with vehicle structure, its flight characteristics and control, and temperature control; and yet another dealt with the integration of all of the complex parts that had to be fitted into a practicable whole.

Finally, at the broad base of the pyramid, were 10 major subsystems. These are concerned with hardware: the physical equipment necessary if the Lunar Module is to accomplish its mission. Subsystems managers direct and oversee a host of concerns, including source of power supply, descent and ascent stages of the moonship, earth-parent vehicle-Lunar Module communications, internal (LM) monitoring of systems, cabin environment (oxygen supply, pressure, temperature), crew provisions, and so on.

The pyramid that has been described, of course, is at best only an inner-visual hint or picture of structure, of overall organization as

Mobility test to measure body motion in pressurized space suit.

# AIR FORCE SYSTEMS COMMAND

**AIR FORCE SYSTEMS COMMAND** as the research and development arm of the Air Force, is responsible for the research, development, production and procurement actions required to place a complete aerospace system into operational use. To provide essential direction and support to this broad spectrum of challenging programs, the Command maintains its own in-house capability through a number of divisions, centers and ranges located throughout the country. The responsibilities and missions assigned to these highly specialized organizations embrace most of the basic scientific and engineering disciplines. Members of Systems Command's professional staff make direct contributions to some of the nations most challenging and vital aerospace programs. Systems Command offers a science or engineering graduate an opportunity to do creative, challenging work across a broad spectrum of technical areas.

## Personnel policies provide for:

Opportunity for advanced study . . .  
Maximum possible freedom of expression and exchange of ideas . . .  
Honorary, academic and cash awards for individual accomplishments . . .  
Plus all the excellent benefits of Career Civil Service.

Obtain additional information by contacting your Placement Office to arrange for an interview when a Systems Command Representative visits your campus, or write, or visit the Civilian Personnel Office at the location of your choice.

## RCA RUNS ON BRAINPOWER

RCA's progress has always been characterized by brainpower—the kind of original thinking that has made this great corporation a leader in virtually every phase of electronics.

Your brainpower is needed for the future—a future that will be even more stimulating than the past.

We have openings for graduates in almost every area: in Engineering and Science; Research; Computer

Marketing; Manufacturing Engineering; Financial; Purchasing; Personnel; and Manufacturing.

There are training programs, graduate study programs or direct assignments in both defense and commercial businesses in many diverse areas and locations.

See your placement office to arrange a campus interview or send your resume to:

*An Equal Opportunity Employer*

**The Most Trusted Name  
in Electronics**

E/O COLLEGE EDITION

you might see it on an organization chart. There's some danger in oversimplifying it that way, however, largely because of two factors. First, the vertical and horizontal lines that make up an organization chart cannot be looked upon as blocks of duties and responsibilities set in concrete; rather, they must be viewed as guidelines for management control *only*. And second, not only is it possible to cross lines—to jump, say, from electronics to reliability—but such cross pollination is encouraged; maximum interplay between disciplines is essential, in fact, to good communications and clear visibility. In the last analysis, then, any man at any level of responsibility is free to consult with any other. The only restriction is what the industry calls "the need to know".

To put this in another way, the traditional line-staff relationships no longer hold. The emphasis today is on different factors, such as specialization, the birth of new ideas, flexibility, and intercommunication (not only within a company but in cooperation with other firms). The scope is virtually unlimited, as are the opportunities. It is truly a fast moving world, one in which yesterday's solutions swiftly become obsolescent and then obsolete, replaced by new solutions that will follow the same route. It is the price—and the heady reward—of a racing science.

It is sometimes frustrating, too; for design changes keep coming in, virtually to the day that the product goes out the door, completed. And there are "little" problems that suddenly mushroom into large ones. For example, engineers tortured their brains for a couple of years in an effort to solve one of those "simple" problems: a vehicle seating arrangement that would also allow the astronauts to view their descent path by looking through windows of the Lunar Module. The original LM design, created by NASA strictly for the purpose of an industry-wide competition, called for four glass windows with a total area of 13 ft<sup>2</sup>. Subsequently, this proved unfeasible primarily because the glass was too heavy. The design also limited basic pressure reliability. In addition, seats took up too much space and weight. One day a NASA engineer made a comment that led to a simple solution: if the astronauts *stood up* during their hour-long descent there would be no need for seats. This permitted the astronauts' faces to be closer to the windows, which then could be much smaller. A simple problem simply solved!

And so it goes day after day, the little twist that makes the big difference. There'll be more little twists before that half-million mile round trip is chalked up on the board of history. It's an exciting business that leads one to wonder: are we in the middle of a scientific and technological revolution, or are we only taking our first baby steps into a world we are yet too young to see? ■

At 50,000 ft. in altitude simulator, Plant 31, test subject is being closely monitored via TV at bio-medical console. LM Environmental Control System is tested at various simulated altitudes.

LEM TM-2 Ascent Stage being lowered into Thermal Vacuum Chamber for testing heat dissipation properties and reaction of its equipment to extremes of heat and cold. Painted stripes were added to vehicle to give skin surfaces the desired emittance coating.

# MAN AND THE SEA

(Continued from page 48)

either air- or hydraulic-lift principles should be usable to water depths of 1000 ft. or more.

The question of how much of a mineral hoard exists in the sea is virtually unanswerable at this point, and awaits a very specialized exploration of the ocean bottom. New types of deep-diving submarines and surface ships, improved free-diving equipment and facilities, and better sonar and optical imaging systems all will be required before any reasonable estimates as to the volume of minerals available and the quality of the ores found can be made.

However, there is little doubt about the fact that, sooner or later, as the cost of extracting and processing minerals from low-grade ores grows higher, there will be an ever-increasing tendency to explore what appear to be favorable ocean areas. It should be recalled that man has actually mined the sea since time immemorial, extracting salt from it. And beach deposits of gold, silver, platinum, tin, diamonds and other minerals, have been mined commercially in a few areas. The diamond mines on the western coast of South Africa are but one example.

The continental shelves offer immediate possibilities of some new commercial harvesting of minerals, particularly phosphate nodules, which may be of interest as a possible new source of fertilizer. Manganese nodules are found in the deeper waters, usually at 16,000-18,000 ft., and

apparently cover many areas throughout the Pacific, as well as some Atlantic areas. Some experts feel that these may become economically attractive within 10 years.

Thus far, we have been talking about the economic benefits to be derived from the sea. However, it is quite obvious that the sea is of enormous military importance as well. As Adm. David L. McDonald, Chief of Naval Operations, recently put it: "We must be able to operate with increasing effectiveness beneath as well as on and over the seas, and concurrently develop instruments to detect submarines at long range as surely as we now detect surface ships and aircraft."

Solving just this one problem is not nearly so easy as it sounds. In fact, it sometimes appears that the oceans have gone out of their way to make it as difficult as possible for the Navy to achieve this purpose.

To begin with, many of the sea's physical properties, and phenomena such as waves, tides, currents and turbulence, electromagnetic and infrared characteristics, radioactivity and optical properties, have implications for equipment design and must therefore be thoroughly investigated. This requirement in turn demands the development of special instrumentation to measure these properties and phenomena.

For example, the sea is layered to an extent which is seldom appreciated, and it has been found experimentally that the transmission of sound is better over certain of the sea's "channels" than others. In other words, there is such a thing as "good" sonar water, through which submarines tens or even hundreds of miles away can be detected—provided, of course, that the right kind of listening equipment is available. Matching the size of the underwater "ear" to the wavelength being listened to is a very complex design problem.

However, it is obvious that increasing the range at which enemy submarines can be detected depends on extensive knowledge of the sea's physical characteristics and how to predict changes in these characteristics, and an intensive Navy effort is being devoted toward this end.

Although we have only scratched the surface here, it is obvious that an enormous range of talent is required to build underwater technology to a point where man truly begins to conquer the sea. It is not merely, or only, an engineering task. It is an exceptional example of a truly interdisciplinary effort, which brings together all of the physical sciences, the life sciences, and even some of the social sciences, as well as engineering science and technology.

One of the things which has been so impressive about the underwater technology effort is the way men with so many different backgrounds have banded together to take on this most difficult job. It is necessary. It will be done.

# DISCOVER THE WIDENING WORLD OF WESTON

**WE HELP  
NORTH AMERICAN  
CONTROL APOLLO  
IN FLIGHT**

**WE HELP THE  
NAVY PUT THE  
PUNCH IN THE  
F4D FIGHTER**

**WE HELP  
THE AIR FORCE  
WITH THIN-FILM  
RESEARCH**

**WE HELP YOU  
ENJOY  
TASTIER BAKERY  
PRODUCTS**

In this age of constant change, one thing doesn't change: America's reliance, since 1888, on Weston for precision measurement.

At this very moment, thousands of Weston products, programs and projects are playing a vital role in protecting our way of life and in our enjoyment of its fruits.

For example, 30 Weston instruments and devices will be aboard NASA's Apollo spacecraft when it takes its history-making orbit around the earth. A revolutionary new azimuth package, encompassing specially designed Weston generators, motors and synchros, gives F4D pilots unprecedented accuracy; it automatically computes target speed, then sets and locks the guns on target.

Weston electron microscopes enable Air Force researchers to probe the basic structure of semi-conductors and thin metallic layers. And Weston bi-metal thermometers make sure that every "Jane Parker" bakery product of A&P is tastier and fresher.

This is but a minuscule part of the activities of our six integrated divisions, which are hard at work keeping pace ...and sometimes setting it...with the diversified needs of industry and government.

Engineers, scientists and professional personnel looking for new challenges are invited to discover the widening world of Weston. And to widen their personal worlds at the same time.

AN EQUAL OPPORTUNITY EMPLOYER

# opportunities in sales engineering

David Retzinger

■ Recruitment of undergraduate engineering students for technical selling careers is highly competitive and today has become an even more important sales function in many firms.

There are sound reasons for this special recruitment effort. First of all there's a great need for sales engineers, and secondly, many of the engineering students still do not understand the requirements and nature of technical selling. Many undergraduates still can not visualize the opportunities that selling affords as a life's work. There are also students who are not aware of the fact that many of the top executives in engineering and manufacturing firms succeeded because they started their careers as sales engineers.

In our own recruitment program, which we analyze every year, we have learned that it is rather difficult to hire a young engineer, and try to direct his abilities into a sales career. After he acquires a knowledge of the many benefits that selling provides, there is a complete change in attitude. We have come to the conclusion that resistance to selling is principally due to the lack of real understanding and knowing how challenging technical selling really is in comparison to the other engineering positions—application, project, research and development, and others.

Technical selling does offer an engineer personal advantages which can be so easily overlooked. Naturally, selling is a glamorous career, and financially it has unlimited boundaries. It provides plenty of opportunity for advancement into top management jobs. Then, too, a sales engineer is quite a different specimen, because

he has had the need to develop his abilities to an optimum, such as, imagination, creativity, perseverance, friendliness and cooperativeness.

A sales engineer is proud to be a salesman. He not only sells the product, but is a disseminator of ideas that develop lasting business

Dave Retzinger, vice president of sales, Perflex Corporation, Milwaukee, Wisconsin, has served in sales engineering for more than 15 years and has held many top-echelon sales positions in his interesting career. He has written this article to encourage engineering students and graduate engineers to take a new look at technical selling as a challenging, stimulating and rewarding career.

## Get your career moving

Get together with Delco Radio, the mover in electronics. Make no mistake—the pace is fast and demanding. But our people thrive on it. They're having a ball, pushing the state of the art clear out of sight in microelectronics and silicon devices. New research programs . . . new products . . . new equipment . . . and plenty of new opportunities for new people. Electrical Engineers. Mechanical Engineers. Physicists. Metallurgists. Physical Chemists.

Challenge—benefits—salary—community. You'll find 'em all at Delco. Get your career moving now! Get together with our interviewers when they visit your campus. Better yet, drop a line to C. D. Longshore, Supervisor, Salaried Employment, Delco Radio Division, General Motors, Kokomo, Indiana. An equal opportunity employer.

### DELCO RADIO

Division of General Motors,  
Kokomo, Indiana

## Lawrence Radiation Laboratory

The continuing emphasis on basic and applied nuclear research programs at Lawrence has created a number of outstanding career opportunities.

### APPLIED RESEARCH PROGRAMS

- PLOWSHARE—peaceful applications of nuclear explosives
- BIO-MEDICAL—radiation effects on the biosphere
- SHERWOOD—controlled thermonuclear fusion
- WHITNEY—nuclear weapons for national defense
- SPACE REACTOR—reactors for power in space

### R&D ASSIGNMENTS AVAILABLE IN: ELECTRONICS ENGINEERS

- Systems Engineering • Instrumentation
- Microwave • Solid State Circuit Design
- Digital Computers • Components
- Measurement Standards

### MECHANICAL ENGINEERS

- Advanced Machine Design • Instrumentation
- Environmental Testing • Applied Mechanics
- Optical Systems • Materials Engineering
- Engineering Measurements
- Analytical and Experimental Stress Analysis

An Equal Opportunity Employer  
U.S. Citizenship Required

Dale Fischer, right, sales engineer, Perflex Corporation, discusses construction of his company's condenser coil used on an air-cooled type air conditioner with Richard Signorelli, manager of manufacturing for the Climatrol Division of Worthington Corporation.

friendships. To a great extent he is his own boss. Often, he is a leader in his community because economically he approaches the professional classes—doctor, dentist, lawyer, professor, architect, etc. In many instances, his earnings average in the top management groups. What's even more important, he will always be in demand. He lives a stimulating life.

The usual impression a student has of a salesman is that conveyed by the Broadway play, "Music Man." In other words, the young engineer has the impression that a salesman is a happy-go-lucky individual who is always on the move, has an unlimited supply of jokes, wears loud clothes, and is always trying to sell a prospective customer something he really doesn't need, and for a price he really cannot afford to pay.

Contrary to these common impressions, sales people cannot be categorized. In every day living, all of us do sell in one way or another. Cooperation between two individuals in any kind of endeavor requires some selling. Therefore, whether we realize it or not, everyone is a salesman at one time or another. Specifically, a sales engineer directs and consciously improves his natural sales ability to the point where he focuses his imagination, intelligence, and creative ability on a specific problem of a technical nature, which will benefit his prospective customer.

And, when a graduate engineer completes his training course and begins his career as a full-fledged salesman, he finds that he has greater freedom than most company employees. He is seldom away from his family for long periods of time. Most companies do not have their sales engineers "on the road" more than five consecutive days. The sales engineer, in his effort to solve engineering problems, has the opportunity to travel widely, normally under first class conditions. Not only does this travel bring him into contact with his customers, but it gives him an appreciation for customs, problems, and ways of living of many individuals, and also the opportunity to exchange ideas with individuals other than those in his immediate community.

## Forward-looking engineers & scientists fit into the picture at Norden

The Norden Head Up Display superimposed upon the pilot's external visual field presents continuous flight information necessary during all critical phases of terrain following, weapons delivery and landing.

Whatever your interest in electronics may be, it is almost certain that you can satisfy it at Norden: pilot displays, airborne radar systems, solid state device development and fabrication precision components and computer techniques. Applications run the gamut of advanced underwater, shipboard, aircraft and space vehicle systems and ground support complexes.

With Norden, you can gain broad exposure to technical aspects of a problem through our method of assigning projects to problem-solving teams. Our corporate-financed Graduate Education Program provides qualified engineers ample opportunity to continue formal education at nearby academic institutions.

Norden's ideal location, in Fairfield County, Connecticut offers an environment for living that's second to none—a rare combination of cultural and sports activity the year 'round and only 41 miles from the heart of New York City.

There are openings in Research, Development and Manufacturing. Electrical Engineers, Mechanical Engineers, and Physicists graduating in 1967 are invited to contact your College Placement Officer to arrange an on-campus interview. Or forward your resume to: Mr. James E. Fitzgerald, Technical Employment Manager, at Helen St., Norwalk, Connecticut 06852. An Equal Opportunity Employer (M&F).

**Norden** DIVISION OF **United Aircraft**

# What do they do at Rohm and Haas that can start your career in engineering?

**They make Plexiglas<sup>®</sup> acrylic plastic, for one thing.**

And more than 2500 other products, including synthetic resins, agricultural and sanitary products, fibers, pharmaceuticals, and chemicals for almost any industry you can name.

Rohm and Haas is a diversified chemical company. And busy. Career opportunities are many and varied for chemical and mechanical engineers. Good new openings develop every year in chemical process development, process engineering and design; in facilities engineering and construction; in marketing and other important areas. One may prove just the spot you're looking for. *This year.*

Rohm and Haas is also a growth company, one of the top 10 chemical companies in the country today. Sales have more than doubled in the past decade, and they're still climbing.

Your personal growth and advancement at Rohm and Haas? It can be as rapid as your abilities can make it. We emphasize promotion from within. Rewards come quickly on the basis of performance.

Anxious to make your first step the right step? Then we're anxious to know you. Send us your resume and tell us about your career interest. You'll hear from us promptly. Write to Professional Employment and Manpower Planning #7, Rohm and Haas Company, Independence Mall West, Philadelphia, Pa. 19105. Plan to see our representative when he visits your campus. Your placement office will know the date.

PHILADELPHIA, PENNSYLVANIA 19105  
An Equal Opportunity Employer (M&F)

The selling process usually involves the solving of a customer's problem in a better way, or at a lower cost, than the customer previously believed possible. It involves the imagination and creativity of the sales engineer to the application of his company's product in solving his customer's problems. In other words, the salesman is a progress maker. Many times, because of the sales engineer's experience and association with many different industries and facets of industry, because of his wide travel, and because of the imagination and creative ability developed through the selling process, he comes up with ideas for products which are needed in the market place to solve specific desires or requirements of the market place. He, therefore, becomes a source of products, or ideas for products, for his company.

In my opinion, the better an engineer is in his engineering profession, the better sales engineer he will be. The sales engineer is normally dealing with other engineers, and they expect him to thoroughly understand his product as well as their problem, and to relate the solving of their problems to his product. He must be able to communicate his ideas to his prospective customer, and show the prospective customer where a better product or a better solution to the problem will result by application of the product he represents.

The company's success starts and finishes with the customer, and the go-between is the sales engineer.

## THAT MOMENT . . .

. . . is when the pilot must get out of his airplane to save his life and hasn't a moment to lose; and it's when he must do it, whether at 450 knots in a tight roll and spin, or at zero altitude and zero speed. It's that moment when his YANKEE Escape System pulls him from the airplane to safety, and a safe parachute descent.

Perhaps a moment of decision has arrived for you . . . when you must decide on your future, your growth, and your expanding horizon in the engineering field. If you're a down-to-earth guy who wants to design and test, then roll up your sleeves and make your ideas work by seeing the job through, the people at Stanley Aviation Corporation want to talk with you now. Your talent and ideas won't have to wait at Stanley.

Stanley Aviation Corporation—the designer, developer, and manufacturer of aircrew escape and survival systems for over fifteen years, is now engaged in the installation of its proprietary YANKEE Escape System in aircraft throughout the world. Mechanical, Civil, Aero, and Electronic engineers are urged to contact us now and discuss our mutual future. Get together with us! All inquiries will be promptly followed through in strictest confidence.

"An Equal Opportunity Employer"

If you're the average grad, holding down a gentleman's "C" and looking forward to a nice quiet nine-to-five routine, we probably won't have much in common.

The chemists, engineers and other scientists at Polaroid are hand-picked professionals, the best brains this country has to offer. They make their own rules in a field where rolled-up sleeves, lots of coffee, and honest sweat are the name of the game. They don't have time to mother-hen a guy chasing a routine.

There's another side of the coin, though: Prove you can think, prove you care enough to get involved, prove you can learn to pull your own oar, and you'll be amazed at how far we'll go for you — in terms of responsibility, excitement, education and reward.

That's why 24 out of 25 Polaroid applicants end up working someplace else.

But that one remaining . . . he's got himself quite a job.

We invite your resume.

Mr. John D. Ingalls  
Corporate Manager of  
Technical Staffing  
POLAROID CORPORATION  
565 Technology Square,  
Cambridge, Mass.

**Polaroid hires  
one applicant out of 25.  
Is he you?**

Polaroid is an equal opportunity employer M/F

# opportunities in application engineering

G. L. Taft

Manager, Application Engineering  
Industrial Compressor Dept.  
Joy Manufacturing Co.

■ What is an Application Engineer? Perhaps the easiest and clearest way to define what an Application Engineer is, is to first say what he is not. He is not a Design Engineer and is not in the Engineering Department in most companies. He is not a Sales Engineer, not being in the Sales Department and not usually calling on customers. He is not an Industrial or Manufacturing Engineer since he is not in the Manufacturing Department. Since these are the major three departments of any manufacturing concern, then where does he fit? Our answer is right in the very middle. In other words, he is in the center of activity which reaches out to the other three areas—Engineering, Sales, and Manufacturing.

Let us proceed to describe what his functions really are . . .

- (A) Apply the product to the application.
- (B) Analyze the cost and assign a price which will prove profitable to the company.
- (C) Support the Sales Department with sufficient technical information to sell the product through the following means:

- (a) Price Book
- (b) Sales Manual
- (c) Sales Literature
- (D) Miscellaneous other duties such as other supplying management with sales forecasts, profitability plans, new product studies, and analyses of lost business reports.

There is no universal term for this group. In some companies the department is called the Product Department, others Marketing Services Department, others Application Engineering Department.

The Engineer who enters this department may come in from college, from another company, or from one of the other operating departments of the same company. His desire, of course, is to get a broader knowledge of the over-all company operation. Frequently, sales engineers, disenchanted with the glamorous life of the salesman, the long hours away from family, but still with a flair for being of service to other salesmen and customers, have the proper attitude for this department, and may grow as rapidly as the fellow salesman who stays in the field.

On the other hand, a trainee in

the Product Department can get his feet on the ground for application engineering and go into the sales department with sufficient technical knowledge to develop into a fine field salesman and district manager. Design engineers with inclinations toward sales can first come into the Product Department before going into the sales and have a very strong background for growth in the company. All these are areas where an engineer has passed through the application engineering group.

However, there certainly is an opportunity for the man who wants to make a career of application engineering to contribute heavily to the success of the overall operation by thorough training in cost accounting, design engineering, sales engineering, and combining them to the fullest extent in the forward look of the company.

Educational requirements are, first, a degree in Engineering in the field of which the company is engaged. In other words, heavy machinery should have a Mechanical Engineering degree. As an alternate, Industrial or General Engineering degree would be acceptable, in fact, desirable, when a business minor is a part of the course. Of course

# Before you make the big decision...

## YOU'LL WANT TO HAVE THESE FACTS ABOUT SANDERS

### WHAT IS THERE TO KNOW ABOUT SANDERS

You don't have to spend much time in industry to learn that Sanders' growth and technical achievements are near models in the electronics community. Eleven brilliant engineer-founders (with a contract for \$117) led the company in 15 years to its position today—personnel roll exceeds 5,000 at 4 locations. In a recent 4-year period, sales nearly tripled to a record \$59.7 million for fiscal '65, and have already passed this for 1966.

### YOU'LL THINK HARD AT SANDERS

Obviously, a lot of hard thinking put the remarkable rise in Sanders' growth curve. As a weapons systems company, Sanders focuses this thinking on aggressive innovations rather than relying on traditional concepts in order to speed the development-to-delivery cycle, and to achieve total-mission reliability. As a technical and business philosophy, this freedom to break with conventional methods of doing things has fostered a creative climate where original ideas multiply, professional knowledge expands and individual advancement is accelerated.

The graduating engineer who seeks a place at the threshold of state-of-the-art should be aware that Sanders pioneers continuously in advanced areas of radar and phased array, missile guidance, communications, ASW/oceanography, ECM, tactical limited warfare, information display and data processing, data storage, ground support, navigational aids, instruments, test equipment, microwave and high density packaging.

### A PLAN TO HELP YOU KEEP ON GROWING

Most important to your professional development is your association with men who can display technical "firsts." These are seasoned men who encourage you to similar accomplishment and who urge you to speak your mind freely. As one Sanders engineer puts it, "Channels of technical communication are wide open here."

Another spur to professional development is the liberal pre-paid tuition program for advanced study at well regarded universities near all Sanders' plant locations. And, too, a growing number of top calibre in-plant courses are offered.

### WHERE YOU FIND SANDERS ASSOCIATES

In Nashua, New Hampshire, Headquarters for the company, this thriving community in beautiful hill country is about 30 minutes from Boston's suburbs. In Bedford, Massachusetts. The new Bedford Division is located in the heart of the "Electronics Row" section—Route 128—near Boston. In Plainville, Long Island, N.Y. Situated on Engineers' Hill in the Plainview Industrial Park, Sanders' Geospace Electronics Division is just 45 minutes from New York City. In Manchester, New Hampshire. Located in the state's Queen City, this facility is conveniently near the airport and the Nashua Headquarters plant.

For additional details on Sanders and the available career opportunities, make an appointment through your Placement Officer to see us. Or write for a new informative brochure to Mr. Lloyd Ware.

# Come to MELPAR

Where Performance Comes **FIRST**

Now celebrating our 21st year in space and defense, MELPAR brings new life to creative pioneering by continually expanding into new areas of R&D and further developing our broad capabilities. MELPAR, intimately associated with Apollo and other major space programs, has exciting opportunities in the following areas:

## NASA Goddard Space Flight Center

Spacecraft and ground support systems with assignments in rf, television, microwave, computer, propulsion and instrumentation.

## Applied Electronics Department

1. RF circuit design for automatic and remotely controlled HF receivers, HF, VHF and UHF Frequency Synthesizers.
2. Design of small special purpose digital computers and programming for real time and control applications, mathematical modelling.
3. Theoretical and experimental design of missile and ground-based microwave antennas and microwave receivers.
4. Advanced circuitry development and computer application related to information handling and processing.

## Simulation & Training Department

Computer systems design, programming and analysis for advanced weapon systems and tactics trainers.

## The Avionics Department

Radar, countermeasures and microminiature packaging techniques for high performance aircraft avionics systems.

## Electronics Research Laboratory

R&D involving propagation of acoustic, seismic and electromagnetic signals in scattering media, such as earth, water and atmosphere to include data compression for long-distance communications.

## Space Systems Laboratory

Space experiments, space chemistry and physics, interplanetary field and particles, electronic systems, mechanical systems, electro-optical systems, spacecraft structures, and control systems.

## Space Research & Technology Center

R&D in physics of materials processes and devices to include power conversion devices, crystals for advanced quantum detectors, thin film electronics, metallurgy of dispersion-hardened and whisker-reinforced metals, phase-change thermal control, solar-driven devices, survival equipments, electro-optics directed toward image amplification devices, component physics of failure, saline water conversion.

## Chemistry & Life Sciences Laboratory

Develop methodology for detecting low levels of microbial contamination in and on spacecraft and space hardware to include Apollo and other major space programs.

## Instrumentation Laboratory

Instrumentation and technology of physical and chemical properties to include gas chromatograph, aerosols, measurements and particle size determinations.

## Bio-Engineering Laboratory

R&D in artificial organs and their physiological significance.

A SUBSIDIARY OF WESTINGHOUSE AIR BRAKE COMPANY

7740 ARLINGTON BOULEVARD, FALLS CHURCH, VA. 22046

(Suburb of Washington, D. C.)

An Equal Opportunity Employer M/F

there is a substitute for a degree in hard work, basic mathematic courses, and a drive to succeed without the degree recommended.

In a sense, the Application Engineer is the storekeeper of a corporation. Profit responsibility often rests in his hands. Poor application engineering means uncertain profitability, poor planning, and sometimes corporate failure. If any plant does not have a strong, aggressive, application engineering or product group, it should consider installing just such a distinct separate function.

The Product Manager would be not only a manager, but ideally an Application Engineer. He should be of the same high calibre as the other managers and able to guide the General Manager in making well-balanced decisions in the overall management of the company.

The ultimate goal for a capable Application Engineer is a top management post. The rewards certainly are as satisfying as any other branch of engineering.

Therefore, young engineer, or reader, consider making a career of Application Engineering.

## RARE OPPORTUNITY

Again this year we are adding a few college engineering graduates to our staff. You will have the opportunity to grow with an exciting division of one of America's largest corporations. Our programs include instrumentation programs, surveillance systems and other exacting electronics and communications projects. You will have the opportunity to live in vacationland San Diego (which, incidentally, has become one of the country's major centers in the electronics industry).

We would like to hear from you if your interests and capabilities are in Airborne Radars, Station Keeping Equipment, CW Tracking Equipment, Computer Programming and Analysis, or Space and Missile Beacons and Transponders.

We will reply promptly to your resume. Send it to Mr. George W. Leesch, GENERAL DYNAMICS, Electronics Division, San Diego Operations, Mail Zone 7-32, 3090 Pacific Highway, San Diego, Calif. 92112.

An Equal Opportunity Employer

We've got the best facilities, the finest benefits, and blah, blah,

# blah!

Sure, you've probably heard it before. Many times.

But the puffery doesn't ring true anymore.

If you've got the experience to know that a man gets ahead on his own demonstrated ability to handle a job, you're the kind of a man Collins would like to talk with.

We aren't even promising you that we have the best, or the most, or the finest of anything. Even if we think so privately, it still remains for you to be convinced it's true.

We do have a little booklet which will tell you something about us. About our facilities, about the

work we do, the places where we work, the cities and towns we live in.

Write us and ask for a copy.

If you like what you read and want to know more, we'll send you some interesting information on the openings we have right now for Industrial Engineers, Quality Assurance Engineers and R & D Circuit Design Engineers.

Drop a card to Manager, Professional Employment, Dept. W, Collins Radio Company in Cedar Rapids, Iowa, or Dallas, Texas, or Newport Beach, California.

# INTERVIEWS on YOUR CAMPUS

The companies advertising in this issue have indicated their intention to conduct campus interviews at the schools under which they are listed in the following pages. However, don't hesitate to send your resume to any firm in whose advertised openings you are interested, whether or not they are listed under your school, as some arrangements for interview can usually be made. Further, recruiting schedules are subject to change and a check with your Student Placement Office may reveal that a company not listed here will be interviewing on your campus. Use the handy Inquiry Form on Page 129 to notify firms of your interest and get your interview scheduled in advance.

# There's a World of Challenge for You at USM

The challenge of putting your ideas to work to ensure a better, more productive tomorrow.

Here, where the country started, in a pleasant seaside community on the North Shore of Boston, USM engineers, chemists and physicists translate ideas into reality — create mechanical and chemical systems used by practically every major industry in the country as well as in outer space.

USM offers rewarding career opportunities within minutes of unparalleled facilities for advanced degree work.

A few of the areas in which broadly-diversified world-wide USM is active are illustrated.

Harmonic Drive units for the automotive industry.

Automatic and semi-automatic machinery systems for the footwear and other major industries.

Assembling and fastening systems.

Mechanical systems for the aerospace industry.

Sealants and coatings for home and industry.

Industrial brushes and brush-like, ski-mat surfaces.

Electronic component inserting systems, precision parts and resistor encapsulations.

For a list of specific openings write: James D. Brown, Personnel Manager. **RESEARCH AND DEVELOPMENT CENTER**

# WORK FOR AN OIL COMPANY?

**Richard W. (Ricky) Stokeld** had never given the idea much thought. Then he signed up to see our campus interviewer. Now look at what he's done—and is doing!

Working as members of a Texaco research team, Ricky and his fellow scientists have brought to commercial fruition one of the world's most important petrochemical processes. This process is one which produces ultrahigh-purity normal paraffins from a selected petroleum fraction.

Why is this important? Because these normal paraffins are the basic raw materials now being used worldwide in the manufacture of biodegradable detergents, the solution to many of the problems associated with the more common variety of detergents. In addition, they are used in numerous other areas such as the manufacture of plasticizers, alcohols, unique solvents, and other petrochemicals.

Ricky never heard of this process before he joined Texaco. He had no idea that he and his associates would not only develop the process in the laboratory, but would also

participate in the subsequent first plant start-up at Texaco's facilities on the tropical isle of Trinidad. At the same time he got some first-hand experience in training process engineers and operating personnel.

Ricky is on the move! In addition to working on the design of another normal paraffin plant to be constructed in Japan, he is now branching out into other fields, including alkylation, hydrogenation, and catalytic reforming.

Richard Stokeld got his B.S. degree in Chemical Engineering from Louisiana Polytechnic Institute in June 1961, and immediately joined Texaco's Research and Technical Department in their modern Port Arthur, Texas, research laboratories.

He has had two promotions since then. His present title is Senior Chemical Engineer.

## SOUND INTERESTING?

If so, sign up to see our interviewer the next time he is on campus, or send your resume to Mr. S. P. Dickens, P. O. Box 509, Beacon, N. Y. 12508. We can provide you, too, with the challenging assignments on which to build your success story. Expanding career opportunities are available for all degrees and most chemistry, engineering, and other scientific disciplines.

# Fifty years ago we only made 'aeroplanes'. (See what's happening now!)

In 1916 The Boeing Company's career was launched on the wings of a small seaplane. Its top speed was 75 mph.

Now, half a century later, we can help you launch your career in the dynamic environment of jet airplanes, spacecraft, missiles, rockets, helicopters, or even seacraft.

Pick your spot in applied research, design, test, manufacturing, service or facilities engineering, or computer technology. You can become part of a Boeing program-in-being, at the leading edge of

aerospace technology. Or you might want to get in on the ground floor of a pioneering new project.

You'll work in small groups where initiative and ability get maximum exposure. And if you desire an advanced degree and qualify, Boeing will help you financially with its Graduate Study Program at leading universities and colleges near company facilities.

Often it will be sheer hard work. But we think you'll want it that way when you're

helping to create something unique—while building a solid career. See your college placement office or write directly to: Mr. T. J. Johnston, The Boeing Company, P.O. Box 3707, Seattle, Wash. 98124. Boeing is an equal opportunity employer.

## the future is in data communications —and you can be part of it!

It's predicted that by 1970 all data processing and computer systems will include data communications. You can be a part of this exciting, rapidly expanding field. Teletype Corporation, the leading manufacturer of data communications terminal equipment for the Bell System and others, has opportunities for all types of engineers—electrical, mechanical, metallurgical, chemical and industrial. You'll have the opportunity to work on many important projects both for the government and industry. The challenges are big, but so are the rewards.

Teletype Corporation is among the better paying communications companies with many opportunities for you to advance to highly responsible positions. As part of the Bell System, Teletype offers insurance, sickness, accident, pension, vacation and numerous other employee benefits—including a tuition-refund plan for continuing your education. And you'll work in modern surroundings, utilizing the latest scientific equipment.

Be a part of the exciting future in data communications, contact your COLLEGE PLACEMENT OFFICER to arrange an interview with a Bell System Recruiter or write to: Mr. James C. Ozello, College Relations, Teletype Corporation, 5555 Touhy Avenue, Skokie, Illinois 60076; or telephone (312) 676-1000.

We are an equal opportunity employer.

Planning Engineers

Harza is the largest consulting firm in its field: development of land, water and power resources, including control of both surface and ground water for agricultural, industrial and domestic purposes, and in the generation, transmission and distribution of electrical power. The work of the company is about equally divided between foreign and domestic operations and serves branches of governments, public and private utilities, governmental agencies, water and power agencies, United Nations commissions, states, regional planning groups, and private industries.

The young engineer joining Harza will gain a wide range of experience in design and planning under the guidance of engineers and scientists of high reputation through assignment to one of the company's six operating divisions in the Chicago Office and may continue his professional development with field work including overseas assignments. Harza provides a full benefits program including insurances and profit sharing while working in an area of wide cultural, educational, scientific and professional opportunity, dynamic Chicagoland.

## A better idea never came out of a crystal ball

At Ford Motor Company we're always looking for better ideas. But not with a crystal ball.

We do it with background and brain.

We do it by seeking answers for down-to-earth questions such as: Should a profitable central city dealership be relocated to a growing suburban location? What's the sales potential for a new personal car?

And we do it by trying to solve problems that haven't been faced till now. Problems such as: Is an electric car the answer to city traffic? How will people travel in the year 2000?

In short, our better ideas come from better people. And we take extra steps to get them. Ford Motor Company has a College Graduate Program

which provides immediate opportunities for individual development. In our rotational assignment system graduates are assured broad training and constant visibility to management. Right now, new products, new marketing programs, new subsidiary operations here and abroad are creating new jobs. One could be yours.

For more information, write our College Recruiting Department. Or better yet, schedule an appointment through your placement office to talk with our representative. He'll be on campus soon—looking for better people with better ideas.

Venture and Acquisition Analysis

While the ink is drying on your diploma, Colombian Carbon Company will be constructing a new-as-tomorrow research center (pictured here) in the greater Princeton, N. J., area to expand the already extensive research and development facilities of its Technology and Planning Division.

Columbian is a diversified growth company with deep roots in research. Colombian produces carbon blacks for rubber and other products, butyl rubber, petrochemicals, synthetic iron oxide pigments, printing inks, plastics resins and colorants . . . with new products yet to come.

Columbian offers unlimited career opportunities to qualified college graduates who have energy, initiative and an inspired curiosity. You work in a dynamic environment to satisfy your urge to create better products and processes. You use the most modern equipment with capable guidance and assistance. You have responsibility while you learn.

Which one of the wide variety of openings at Colombian best fits your interest and education? Write now and find out! Address your letter to:

Dr. G. S. Samuelsen, P. O. Box 975, Princeton, N. J. 08540

AN EQUAL OPPORTUNITIES COMPANY

The Colombian research center is part of the Cities Service \$10 million research complex now under construction in the greater Princeton, N. J., area.

### It's a good system if you like it

There are slots.  
Slots need people to fill them.  
Someone exists who was born and educated to fill each slot.  
Find him. Drop him in. Tell him how lucky he is.  
Look in once in a while to make sure he still fits his slot.

This orderly concept has much to commend it, plus one fault: some of the people most worth finding don't like it. Some very fine employers have not yet discovered the fault. It is not up to us to point it out to them. Luckily for us, we needn't be so tightly bound to the slot system.

We can offer choice. A certain combination of the factors diversification, size, centralization, and corporate philosophy makes it feasible to offer so much choice.

Choice at the outset. Choice later on. Choice between quiet persistence and the bold risks of the insistent innovator. Choice between theory and practice. Choice between work in the North and South. Choice between work wanted by the government and work wanted directly by families, by business, by education, by medicine, by science. To the extent that the slot idea helps channel choice we use it, of course.

A corporation such as this is one means of coordinating the strength of large numbers of effective persons. You may feel that in the years ahead this type of organization must change. You may feel that it must not change. Either way, to get a chance to steer you have to come on board.

Advice to electrical engineers, mechanical engineers, chemical engineers, chemists, and physicists—still on campus or as much as ten years past the academic procession: while one starts by filling a slot, it soon proves more fun to make one. No detailed list of openings appended herewith. Next week it would be different. G. C. Durkin is Director of Business and Technical Personnel, Eastman Kodak Company, Rochester, N. Y. 14650.

TRADEMARK

# If you still think glass is just glass,

## ask a clinical chemist.

Determining the pH, or relative acidity, of a patient's blood is a routine part of many physical examinations. Until recently, this was a time-consuming process. It involved the use of a cumbersome water bath to maintain the blood sample at body temperature. Now all it takes is 15 seconds. Ask a clinical chemist.

The difference is a new blood pH system designed and engineered by Corning research. Heart of the system is an electrode with a glass element that senses the difference in acidity between the sample and a liquid of standardized pH. A proportional electronic heater holds the temperature of the sample to within  $\pm 0.01^\circ\text{C}$  of any preselected temperature. Warm-up time from plug-in is only 3 minutes. An aspirator provides for quick flushing of the electrode after each use.

Sophisticated instrumentation like this is just one more

example of the new glitter in glass. Today, glass can be made six times stronger than steel. Or as soft as silk. It can bend or not bend. Break or not break. Melt or not melt. It can be molded, cast, machined, drawn and pressed. In short, it possesses more useful capabilities than any other known material.

For solutions to their materials problems, industry and government are coming to Corning. Because Corning is the glassmaster. It's a broad, international company, with one of the most daring, expert and imaginative research and engineering staffs in the world. Plus a marketing principle that commits them to developing products only in areas where a need exists and no product does.

Engineering and science majors will be particularly interested in career opportunities at Corning, some of which are listed on the opposite page.

# To learn more about the challenge in glass,

## ask Corning.

The new blood pH system described on the page opposite is one of 43,000 Corning products, many on the frontiers of modern technology. Because Corning products are used throughout American industry, and because of Corning's growth through product, process and material innovations, we need talented people in virtually every branch of engineering. And because we're growing rapidly—at our current rate, our sales double every seven years—we need lots of them.

Right now, we have positions open both in the Corning, N.Y., area and in 26 other communities in 15 states. Some of these positions are listed here. To get the full story on career opportunities for engineering majors at Corning, simply mail in the coupon. And be sure to look for the Corning representative when he visits your campus.

**Product Development Engineer** Designs and develops fundamentally new products for tomorrow's business, such as fibre optics, fluidic devices and integrated circuits.

**Machine Equipment Development Engineer** Conceives and designs new high-speed production equipment required in the manufacture of new products for new and existing markets, such as integrated circuits, color TV and consumer appliances.

**Process Engineer** Designs and develops new manufacturing processes and maintains the efficiency of existing processes.

**Industrial Engineer** Conceives and carries out plans for new manufacturing systems and improves existing plant layout. Also performs capacity studies, standard and cost analysis and business system design.

**Control Engineer** Designs appropriate control systems for manufacturing processes, supervises installation of equipment ranging from standard components to analog and digital computer.

**Other Opportunities** exist in customer engineering sales, quality control, systems research, production supervision, research and development. Programs exist to attain advanced degree at company expense.

## THE EXCEPTIONAL MAN

Wanted—for a challenging position in an American industrial or research organization . . . The Exceptional Man.

He is ready for a career opportunity with a nationally known organization offering immediate rewards and unlimited potential for personal growth.

He is a recent graduate with a background in electronic or mechanical engineering, physics, mathematics, operations research, chemistry, materials science or industrial engineering. Opportunities exist for Bachelors, Masters and PhD candidates.

He is wanted by one or more of our prominent clients for a future in industry, university-affiliated research or non-profit research. These organizations, located throughout the United States, pay all our charges.

They want us to locate The Exceptional Man. May we hear from you?

## Engineering Opportunities

We are a leading producer of numerical controls for point positioning of machine tools, located just south of Buffalo, New York, in a pleasant suburban area. Moog, Inc. is a young, small/medium sized company which provides an environment conducive to utilizing the enthusiasm and inventiveness of young minds and new ideas.

We seek graduate Mechanical Engineers, preferably with MBA, who possess unusual personal qualities of drive and intelligence and have the desire and potential to move into any area of management in the near future. They must have the capabilities to work closely with top management and display administrative ability found only in exceptional young men.

Our successful candidates have major roles in the growth of this dynamically expanding company. Our unique opportunities for professional growth and remuneration package are unusually attractive.

A resume describing training, experience, and salary level will be given prompt attention. Please reply to

# AIRCRAFT ENGINEERS!

choose the position you want...and live in  
Oklahoma City in the mild, clean Southwest!

## JOIN AERO COMMANDER

... world's only manufacturer of business aircraft in all three propulsion categories; the pure jet JET COMMANDER, the prop-jet TURBO COMMANDER, and the piston powered GRAND COMMANDER and AERO COMMANDER 500U!

### AERONAUTICAL ENGINEERS

Work in one of the dynamic areas of research, development and design for aircraft manufacturing including flight test, aerodynamics, loads, design, modification, master layout, airframe, stress, and drawing check-out. Board and analytical work requirements.

### MECHANICAL ENGINEERS

Work in product design or analysis areas including standards, propulsion, systems, liaison, maintenance design, fabrication and assembly.

### ELECTRICAL ENGINEERS

Work in aircraft electronics and electrical systems, developmental and applications.

### INDUSTRIAL ENGINEERS

Work in area of manufacturing engineering, tooling design, machine specification, production planning, etc., or in methods and standards engineering; assembly operations, fabrication, welding or machine shop tooling.

### SEND RESUME AT ONCE

to Employment Manager, Aero Commander, 7300 N.W. 50th, Oklahoma City, Okla.

## On the Waterfront at Annapolis . . .

## Growth opportunities for engineers and scientists

The expansion of the research and development program of the U. S. Navy Marine Engineering Laboratory, Annapolis, Maryland, has created openings for college graduates with B.S., M.S., and Ph. D. degrees at salaries ranging from \$6,387 per year and up, depending on type of degree and scholastic standing. Typical duties are:

**CHEMICAL ENGINEER**—Research and development work in chemical and electrochemical processes; gas and fluid flow systems and equipment; air and water treatment systems; semi-conductor materials; lubrication; fuel systems and processes; filtration; hydraulic fuel systems.

**ELECTRICAL ENGINEER**—Research and development in electrical power and its control; magnetic fields; ship control systems; instrumentation; electro-chemical processes; electro or electromechanical equipment silencing; or other naval or shipboard electrical applications.

**ELECTRONIC ENGINEER**—Research and development in electronics, servomechanisms, electro and mechanical devices; instrument and panel illumination, pressure measurement and fluid flow measurement.

**CHEMIST**—Engaged in application of chemical principles to the areas of water treatment and purification, corrosion and deposition in naval equipment, atmosphere purification, thermoelectric materials, fuel cell power generation, lubrication, fuels, hydraulic fuels, and instrumental analysis.

Each appointee receives the complete benefits of career Civil Service and regular salary increases in grade. Applicants must be college graduates. All qualified applicants will receive consideration for employment without regard to race, color, or national origin. Relocation expenses will be paid.

## Avionics engineers, experienced and recent graduates:

# automatic landings are here!

Flying weather is not always good. Sometimes it gets bad enough to foul up operations. Storms, cloud cover and fog may delay aircraft landings and even cause re-routings.

Sperry Phoenix Company is helping solve this problem by designing and building flight control equipment that allows aircraft to come through this weather. The Boeing 727 has been authorized for fully automatic landings when equipped with Sperry's new "touch-down" system.

This accomplishment is just one of the many reasons why Sperry Phoenix is recognized as a world leader in the development and production of flight controls and flight instruments. There is hardly an aircraft flying today which doesn't rely on Sperry customized equipment, whether it's a small executive plane, a large airliner, or an orbiting space vehicle. The majority of our order backlog in commercial (65%) and is spread out over dozens of major contracts. We have steadily grown to nearly 3,000 employees in ten years of operation (without a lay off) in our ultra-modern facilities in Phoenix, Arizona.

Phoenix is a very clean, beautiful, friendly city with a warm year 'round climate, low cost housing, and Arizona State University which offers advanced Engineering degrees.

We offer training opportunities to recent graduates and advanced placement to experienced engineers in the following areas: Gyroscopics • Mechanisms • Circuit Design • Advanced Avionics • Research and Development • Auto Pilots • Magnetics • Compass Systems • Instrument Displays • Standards • Publications • Logistics • Industrial Engineering • Manufacturing Engineering • Product Support

All resumés submitted will be acknowledged and held in strict confidence. U.S.A. citizenship is not mandatory. Please direct your inquiries to: Employment Manager.

WHERE IDEAS  
UNLOCK THE FUTURE

The key at Bendix is development, and the most dynamic thing we do is develop engineers who develop ideas. We offer career development opportunities to electrical engineers in microwave circuit, electronic product, and electronic test equipment design, and in manufacturing and facilities. Opportunities await chemical and mechanical engineers in electrochemistry, materials, and manufacturing engineering. Industrial engineers can grow in methods and facilities engineering. To discuss your career opportunities at Bendix, please write: Mr. R. E. Cox, Box 303-NI, Kansas City, Mo. 64131.

#### PRIME CONTRACTOR FOR THE AEC

Bendix, Kansas City, a prime contractor of the Atomic Energy Commission and equal opportunity employer, is engaged in the production and procurement of electrical and mechanical non-nuclear components and assemblies for bombs, missile warheads and experimental weapon devices.

#### Barber-Greene

• Barber-Greene Company, an international manufacturer of heavy construction equipment, was founded in 1916 and has 2500 employees. In addition to being the world's largest manufacturer of asphalt paving equipment, the Company also makes rock crushers, ditchers and bulk materials handling and processing equipment.

• Since 1955 corporate sales have tripled and manufacturing facilities have been expanded or added in Illinois, Wisconsin and Ontario, as well as Brazil, Australia, Mexico and Holland. Barber-Greene equipment is sold throughout the world by over 200 distributors.

• Opportunities for civil, mechanical and industrial engineering graduates are available in design, development, sales, manufacturing, and field engineering. Engineers are individually trained, based on their interest, experience, desire and ability. Most management positions are filled from within the Company, and engineering graduates are found at all levels of the organization's structure.

• An excellent fringe benefit program is provided which includes a liberal retirement plan, salary protection, hospital-medical-surgical, and group life insurance programs, in addition to a cash profit sharing plan.

• The headquarters office and main plant facilities are located in Aurora, Illinois, 40 miles west of Chicago. This area combines the advantages of being near a cultural center together with the benefits of suburban living.

Aurora, Illinois 60507

# We need you to come up with solutions for problems we don't even have.

There's an old saying that goes, "For every solution, there's a problem."

What it really means is, every time somebody comes up with a better way to do something, somebody is sure to come up with a reason why it can't be done. ("We've never done it that way" is a popular one.)

With all due respect, we don't believe in that old saying at Mobil.

If we did, we'd never have gotten to be the country's sixth largest industrial corporation.

Which brings us to you.

We'd like to be the country's fifth largest industrial corporation.

So we need more people to

work for us who aren't afraid to make waves.

We need engineers, geologists, geophysicists, chemists, and mathematicians.

We don't care what color, age, religion or sex you are. If you're qualified for the job and feel that we're the kind of company you want to work for, we want to talk with you.

Just write Mr. Robert W. Brocksbank, Manager Recruiting, Mobil Oil Corporation, Dept. 2013, 150 East 42nd Street, N.Y., N.Y. 10017.

Who knows, maybe we can solve *both* of our problems.

# Mobil

© MOBIL OIL CORP.

# RARIN' TO GO?

...around TRACOR you'll  
need track shoes  
to keep up.

We're on the move. Fast. Revenue just under \$10 million last year, up at least 40% every year since '61—net income up 19% or more each year, and '66 just as bright.

We've been labeled "one of the Southwest's finest and fastest-growing advanced technology firms."

We could take exception to the "Southwest" limitation; we base in Austin but have operations and facilities in California, Maryland, Wisconsin, Ohio, and D.C.

Last time we looked there were more than 1000 of us—over 5% Ph.D.'s, about 11% MS/MA's and more than 20% BS/BA's. We're expecting a total of about 3000 by 1970. Maybe 4000.

Right now we're looking for up-and-coming technical graduates interested in:

- Ocean Sciences
- Aerospace
- Chemistry
- Physics
- Systems
- Materials
- Acoustics
- Time & Frequency
- Sensory Information
- Sociometrics
- Analytical, Medical and Industrial Instruments
- Computer Services

Sound like your kind of race? If so, let's communicate.

P.S.—Don't forget your track shoes.

- as well as
- APPLIED SCIENCE

Live and work on the coast in  
a healthy, smog-free climate an  
hour's drive from Los Angeles  
or Santa Barbara.

Openings in the following  
classifications:

- Mechanical Engineers
- Hydraulic Engineers
- Electronic Engineers
- Structural Engineers
- Materials Engineers
- Electrical Engineers
- Civil Engineers
- Operations Research Analysts
- Technical Publications Editors

NCEL offers special educational  
programs. Each year a promis-  
ing young scientist or engineer  
is granted the NCEL fellowship  
which allows him a full year of  
study at the school of his choice  
with full pay.

U.S. citizenship required.

Send resume to:

# RARIN TO GO?

...around TRACOR you  
need track shoes  
to keep up.

We're on the move. Fast,  
just under \$10 million last  
at least 40% every year since  
net income up 19% or more  
year, and '66 just as bright.

We've been labeled "one of  
Southwest's finest and fastest  
ing advanced technology firms."

We could take exception to  
"Southwest" limitation; we're in  
Austin but have operations in  
cities in California, Maryland,  
consin, Ohio, and D.C.

Last time we looked there  
more than 1000 of us—over  
Ph.D.'s, about 11% MS/Masters,  
more than 20% BS/BA's. Varying  
pecting a total of about 4000.

Right now we're looking for  
and-coming technical graduates  
interested in:

- Ocean Sciences • Time & Frequency
- Aerospace • Sensory Information
- Chemistry • Sociometrics
- Physics • Analytical, Mechanical
- Systems • Industrial Inspection
- Materials • Computer Science
- Acoustics

Sound like your kind of race?  
let's communicate.

P.S.—Don't forget your track shoes.

## Careers in Commercial Nuclear Power

Combustion Engineering's Nuclear Division offers an attractive and rewarding future to college graduates. The company's rapidly expanding role in the design, development and construction of nuclear reactors for the generation of electrical power is constantly providing new opportunities for scientists and engineers to achieve truly long term professional growth and development.

Our technical staff, directed by some of the world's most distinguished nuclear experts will provide you with the best on-the-job training available in the nuclear industry and encourage your participation in our company-sponsored program for advanced education.

### YOUR CHOICE OF ASSIGNMENT:

- HEAT TRANSFER ANALYSIS
- MECHANISM AND STRUCTURES DESIGN
- SYSTEMS ENGINEERING
- TRANSIENT ANALYSIS
- REACTOR CONTROLS AND INSTRUMENTATION
- SAFETY ANALYSIS
- REACTOR PHYSICS
- METALLURGICAL ENGINEERING

FOR ADDITIONAL INFORMATION WRITE JOHN FAUCETTE, PERSONNEL DEPARTMENT.

WINDSOR, CONNECTICUT 06095

An Equal Opportunity Employer, M-F Plans for Progress Company

Here at AC Electronics  
we've got a system  
for keeping our people  
interested in their work...

...the solar system.

At AC Electronics the solar system is our workshop. Some of our work is far out. Like building the guidance/navigation system for Apollo and LM; or working on SABRE, the new Self-Aligning Boost and Reentry system for missiles; on the Manned Orbiting Laboratory (MOL); on the Titan III-C Space Booster; and on supersonic and subsonic aircraft of the future.

Some of our work is more down to earth. Like the Ship's Self-Contained Navigation System (SSCNS) we're working on for the Navy; or the fire-control system for the new Main Battle Tank, a joint U.S.-Federal Republic of Germany program; and advanced digital computer development for other military, space and commercial applications.

That's why life is never dull at AC Electronics. If there's anything new under the sun, chances are we're working on it. And just to make sure you're kept up on what's new, there's our Career Acceleration Program, which includes "in-plant" instruction. There is also a Tuition Refund Plan available for any college-level courses taken to advance your career.

If you're completing your B.S. or M.S. degree in E.E., M.E., Math or Physics, check into the exciting career opportunities at any of our three locations—Milwaukee, Boston, and Santa Barbara.

See your college placement office, or write: Mr. R. W. Schroeder, Dir. of Scientific & Professional Employment, AC Electronics Division, Dept. 5753, Milwaukee, Wisconsin 53201.

Ph.D.s, please note: positions are available in all three AC locations, depending upon concentration of study and area of interest.

Concept to hardware—  
it's your baby.

At Western Gear we have a great formula for keeping our mechanical engineers excited about their jobs. It's simple. Each job is the engineer's baby. He contacts the customer to get first hand information about what is needed. He designs the product to meet the requirements. He follows it through from design to hardware. And, if needed, he goes to the customer to see that it works.

If you're thinking about a career in mechanical engineering, consider this: We've had tremendous growth in the nearly 100 years we've been in business. Our different divisions create products from

delicate artificial kidneys to steering engines for aircraft carriers—with many interesting things in between. We have a unique 17-week training program that lets you work in all our divisions. We're on the West Coast, with the recreational, educational, and seasonal advantages you've heard so much about.

Those are the career engineering advantages at Western Gear. We're interested in you. It's your move now. Write to:

Western Gear Corporation,  
Box 186, Lynwood, California 90262

# Unusual Opportunities FOR YOUNG Engineers

*Be part of new,  
important nuclear  
submarine program  
at Charleston  
Naval Shipyard*

Electrical • Electronics •  
Mechanical • Marine •  
Naval Architect •  
Structural • Welding •  
Metallurgical • Chemical •  
Quality Control

Starting Salary  
Up To \$7729

Depending on qualifications

Career Civil Service positions  
with generous benefits, regular  
salary increases, excellent  
opportunity for advancement.

Engineers will find an  
exceptional environment for  
professional growth at the  
Charleston Naval Shipyard,  
a support facility for nuclear-  
powered Polaris submarines and  
other modern naval vessels  
—and they will enjoy excellent  
living conditions, splendid  
recreational and cultural  
facilities in beautiful and  
historic Charleston.

# We're looking for Ph.Ds who'd appreciate the university atmosphere with the personal advantages of working for private industry.

**T**HE Avco Everett Research Laboratory is a somewhat unusual institution, at least by the  
normal standards of industry.

It is run by Research Scientists who are engaged in pure research in Aero Physics,  
Atomic Physics and Plasma Physics. Many of its people have made for themselves an international  
reputation in the scientific world. And in the process, they have given the Laboratory  
a worldwide reputation in the field of high temperature gas dynamics.

The university atmosphere, and the use of an interdisciplinary approach, account for the  
accomplishments and high reputation of the Laboratory and its Research Scientists. It is certainly one  
of the factors which continues to attract men and women with their doctorates to the Avco Everett  
Research Laboratory.

Right now, we're looking for some particularly qualified Research Scientists who would  
appreciate working in this academic climate, and who would equally appreciate the personal  
advantages of working for private industry. Within obvious and reasonable boundaries, they'll be  
able to do the work they wish to do, and add to their personal reputations in the scientific world.  
The publication of papers is encouraged; indeed, the Laboratory's output of meaningful  
papers on high temperature gas dynamics is unique by any objective standard.

Interested? We'll send you a bibliography and abstracts of recent research papers published by  
staff members to assist you in your evaluation. Write to Mr. Louis Rudzinsky, Avco Everett  
Research Laboratory, 2385 Revere Beach Parkway, Everett, Mass. 02149.

# RAYTHEON

The Bedford R&D Center of Raytheon's Missile Systems Division has immediate openings for R&D personnel who seek to join a team working at the forefront of the many varied fields of electronics. The Division has challenging opportunities for physicists, engineers and mathematicians with PhD, MS and BS degrees to contribute to a broad spectrum of R&D projects.

*The following staff openings exist as a result of expansion and long range programs:*

ANTENNA DESIGN  
MICROWAVE ENGINEER  
RADAR SYSTEMS  
RADAR SYSTEMS  
ELECTRO OPTICS  
RADAR RECEIVER  
RADAR TRANSMITTER  
SIDELOOKING RADAR  
PHASED ARRAY RADAR  
TRANSISTOR CIRCUIT DESIGN  
DIGITAL SYSTEMS  
MISSILE GUIDANCE  
HEAT TRANSFER  
OPERATIONS ANALYSIS  
(WEAPONS SYSTEMS REQUIREMENT)  
PROPULSION  
RELIABILITY  
SYSTEMS ANALYSIS  
STRUCTURES  
FIRE CONTROL SYSTEMS  
PROJECT ENGINEERS  
(ELECTRONICS, ELECTRO-  
MECHANICAL & SYSTEMS)

Raytheon offers other personal security and CAREER development advantages.

In addition to our comprehensive employee benefit program, you will be able to pursue advanced studies at renowned New England educational institutions.

TEST EQUIPMENT DESIGN  
C. W. RADAR  
ASW  
PULSE RADAR  
PRODUCT DESIGN  
SPEC WRITERS  
TECH WRITERS (DIGITAL COMPUTER)  
SCIENTIFIC PROGRAMMER  
APPLIED MATHEMATICIAN  
NUMERICAL ANALYST  
AERODYNAMICS  
CONTROL SYSTEMS  
ACOUSTICS ENGINEERS

PERT  
PROJECT MANAGERS  
MAINTAINABILITY  
MECHANICAL DESIGN  
INTEGRATED CIRCUITS (SOLID STATE)  
COMMAND & CONTROL SPECIALISTS

Please call or send resume to  
Mr. Frank DeChristopher  
Raytheon Company  
Missile Systems Division  
Bedford, Massachusetts  
Area Code 617-274-7100, Ext. 2138

EXCELLENCE IN ELECTRONICS  
An Equal Opportunity Employer

Get away from  
the crowd—

with  
a company  
that dares you  
to be different

We want idea men—  
with degrees in  
*Electrical, Mechanical,  
Industrial and  
Chemical Engineering,  
in Engineering Physics,  
and Physics Majors.*

Sangamo Electric Company has designed, developed, and manufactured precision electrical equipment for 68 years. Central offices are in our Springfield, Illinois plant, with additional plants in Pickens and Oconee, South Carolina. The corporate family also includes sizable subsidiaries in Canada and England. Domestic employment presently totals 4,000.

Go with Sangamo and you'll have an opportunity to live and work in a progressive, Mid-America community. Moreover, you and your ideas won't be set adrift among overlapping battalions.

Advanced degree opportunities are available under the Sangamo Advanced Degree Plan, which provides complete reimbursement for tuition and books and full salary during resident requirements.

Current product lines include Magnetic Tape Instrumentation, Data Communication Specialties, Electronic Components, Electro-Mechanical Devices, Ultra-Sonic Delay Lines, Anti-Submarine Sonar and Electric Metering Equipment. More are in the works—Sangamo is strong in product development.

#### CAREER OPPORTUNITIES

in Southern California at one  
of the Navy's newest  
activities.

A recognized and respected major element in the engineering establishment of the United States Navy—THE NAVAL SHIP ENGINEERING CENTER—offers both newly graduated and experienced engineers in mechanical, electronic, and electrical engineering fields opportunities in such areas as:

- Systems Engineering
- Installation Design
- Thermal Design and Analysis
- Circuit Analysis
- Ship's Electrical Systems
- Ship's Air Conditioning Systems
- Ship's Ventilation Systems
- Ship's Steam Heating Systems

These positions offer good salaries, early responsibility, an outstanding employee benefit program and opportunities for advancement.

Located in a smog-free suburban setting on the sun-bathed shores of Southern California, midway between Los Angeles and Santa Barbara.

Send your resume or (SF 57) to:

#### NAVAL SHIP ENGINEERING CENTER

Port Hueneme Division, Code A12C1

Port Hueneme, California 93041

## Picture yourself as a Western Electric engineer. What might you be doing?

As a MANUFACTURING ENGINEER you'd work closely with Bell Telephone Laboratories engineers on the latest concepts in communications systems. It would be your job to work out production techniques for these systems, which might mean developing special tools, machines, or test equipment. You would have the opportunity of guiding products from their final stages of development to the point where they roll off the production line.

As an INDUSTRIAL ENGINEER your work would be more closely related to the search for new ideas to reduce the cost of currently manufactured products, to improve their quality or make the job easier. Many of the Industrial Engineer's problems relate to human engineering as well as to operations research and the establishment of wage incentive rates.

As a SYSTEMS EQUIPMENT ENGINEER you'd really know how a communications system operates, because you'd have built it on paper before it was manufactured and installed. After one of your systems had been installed, you'd be held accountable for its performance and compatibility with existing systems.

As a MILITARY SERVICE ENGINEER you'd be concerned with research, design, development, testing, production, delivery, and assistance to the military in the operation and maintenance of complex military systems. Systems applications range from the ocean depths to outer space. You could expect a wide variety of engineering assignments in many diverse fields.

The challenges are big at Western Electric—and so are the opportunities. Now is the time to investigate them. Be sure to talk to the Western Electric people on the Bell System recruiting team when they visit your campus.

For advance information, get a copy of our career opportunities booklet from your placement officer. Or write: College Relations Staff Manager, Western Electric Co., Room 2510A, 222 Broadway, New York, N.Y. 10038. An equal opportunity employer.

## Graduating A.E. & M.E. Engineers

## LET'S TALK FRANKLY FOR A MOMENT!

By now many companies have told you what they have to offer. Chances are you are now trying to decide which offer to accept.

Right now, take the time to ask yourself this question, "What am I really looking for in a company?" If you're looking for an engineering position that offers you the responsibility and freedom to follow your design ideas all the way to the customer . . . and looking for a position that offers you a variety of interesting assignments on different projects, both military and general aviation, that increases your ability and worth as an engineer, then, you should consider CESSNA AIRCRAFT COMPANY.

Before you make a decision, learn the complete CESSNA story. Discover how CESSNA has grown to become the world's leading producer of general aircraft. Send your resume to:

Engineering Placement

# Looking for your first full-time engineering job?

Come to us:

## A mark of excellence in nuclear power.

The Bettis Atomic Power Laboratory, operated for the Atomic Energy Commission by Westinghouse, specializes in "firsts." The Laboratory developed the first nuclear powered submarine reactor plant (USS Nautilus), the first reactor plant for central station electric power generation for civilian needs (Shippingport Atomic Power Station), the first nuclear powered surface ship 2-reactor plant (USS Long Beach), and the first nuclear powered aircraft carrier 8-reactor plant (USS Enterprise). To do this, we utilized advanced concepts, procedures and equipment. We are now searching for engineers and scientists trained in the techniques of tomorrow,

who will apply their talents to the ever growing field of Nuclear Reactor Technology.

What can we offer you? A chance to expand what you've learned. An opportunity to work with your peers. And a challenge to pioneer on some of today's most exciting horizons.

Bettis Laboratory is located in West Mifflin, Pa., 12 miles south of Pittsburgh. The Laboratory also maintains a test site at the Naval Reactors Facility in Idaho Falls, Idaho. Positions are available at both locations.

### Current openings include:

#### MECHANICAL & CHEMICAL ENGINEERS

Mechanical design, thermal and hydraulic design and analysis, heat transfer and fluid flow, theoretical and applied mechanics; and shock and fatigue behavior of reactor fuel elements.

#### METALLURGICAL & CERAMIC ENGINEERS

Applied research in the field of irradiation effects, fuel element fabrication and design, fabricate and test experimental fuel elements,

develop metallurgical welding, forging, rolling and extrusion techniques.

#### NUCLEAR ENGINEERS AND PHYSICISTS

Theoretical and experimental assignments in reactor theory and nuclear analysis critical experiments, reactor stability and transient response.

#### SCIENTIFIC PROGRAMMERS

Develop computer programs for applications on high-speed digital computer for the solution of reactor

physics and engineering problems.

#### DOCTORAL PROGRAM—ATTENTION JUNE GRADUATES

Engineering or science graduates to participate in cooperative work study program leading to Ph.D. degree with Carnegie Institute of Technology or University of Pittsburgh. Full tuition, textbooks and fee costs reimbursed. Up to 18 months paid leave for doctoral research. MS Engineering or Science Graduate preferred.

Direct replies to Mr. A. J. Brendza, Dept. 4867

U. S. NAVAL AIR TEST FACILITY  
(SHIP INSTALLATIONS)  
at Lakehurst, New Jersey

A fast moving, dynamic Naval Activity with diversification that appeals to the Junior Engineer looking for a challenge!

#### AMONG CURRENT PROJECTS:

**SATS**—Development of a Night Lighting System for the Short Airfield for Tactical Support Program. SATS is a portable airfield concept for launching and arresting aircraft from limited runway space.

**C-13**—Shipboard Steam Catapult. Developmental Testing and Evaluation of the world's most powerful catapult to be installed on the USS John F. Kennedy.

#### ENGINEERS NEEDED:

**MECHANICAL**—Performance Test

**ELECTRONIC**—Instrumentation

**ELECTRICAL**—Design

Positions are available at the GS-5, 7 and 9 levels with the U. S. Navy in the Career Federal Civil Service.

## Destination? Orlando, Florida!...To conduct a successful career interview with Martin Company

Picture yourself on this journey. Within hours you'll be shaping your future with the top engineering team now designing and producing Sprint, Walleye, RADA, Shillelagh, Pershing and many other advanced systems.

In flight, you can prepare for that career interview by considering these points. Our conversation will focus on the importance of the engineer at Martin and how our personal development program guides his professional growth.

Your side of the conversation? You should make a bid for a front-row seat on this team by showing how you can contribute to the high standard of technical excellence that characterizes Martin.

And by the way. Just before your plane touches down, look out the window and see how Orlando

is situated in the heart of Florida's lake country. It's a great place to live!

You can put yourself in this picture by seeing the Martin representative when he visits your campus. Or write to Mr. John Pavey, Sec. 1507, Martin Company, Orlando, Florida.

## Come with us and enjoy the good life.

We'll give you a king-size ash tray. The kind you need for king-size thinking.

Why are we so generous? We know fresh new ideas don't come easily. And we're prepared.

Prepared to give you enough time to breathe. And experiment.

Researcher. Manufacturer. Marketer. It makes no difference.

New approaches to old problems can be used anywhere. And they will be used. Here. Whether they come from a ten-year veteran or a brand new recruit.

Pensions, insurance, stock, hospitalization—these you can get anywhere (including here).

But king-size ash trays? That's the good life.

of it?

## Join Gulf's going-places scientists in a new phase of research and development

In Pittsburgh, called by many "America's Research City", GULF has opened up the most attractive opportunities in its history for exploring and creating new uses for oil and oil-derived products.

Here, between city and country and less than 15 minutes from the heart of both, you'll work in an ideal atmosphere for career development, enjoying the fullest scope for exploring and firming your talents. Lateral as well as vertical advancement, generous benefits, excellent salary scales combine with remarkable educational, cultural and professional facilities to make GULF your best choice careerwise and otherwise.

### CHEMICAL ENGINEERS • PETROLEUM ENGINEERS

Challenging work, allowing independent as well as team activity will involve you in bench scale, pilot plant, new process research and development, economic evaluation and model simulation.

We're also interviewing MECHANICAL and ELECTRICAL ENGINEERING graduates.

See your Placement Officer for the date our recruiter will be on your campus and make arrangements to interview us, or send a brief resume of your training and experience to:

**JOHN C. DUECKER**

SUPERVISOR, EMPLOYMENT & COLLEGE RELATIONS  
GULF RESEARCH & DEVELOPMENT COMPANY  
P. O. DRAWER 2038, PITTSBURGH, PENNSYLVANIA 15230

## ENGINEERS AND SCIENTISTS

Engineers and Scientists go places fast while developing a wide variety of mobile military equipment in one of the world's best equipped laboratories at a historic site located just 15 miles south of the nation's capital. As a key agency of the U.S. Army Mobility Equipment Command, which is headquartered in St. Louis, Mo., "ERDL" develops materiel and techniques which enables troops to clear the way for our forces . . . and impede the movement of the enemy.

- Civil Engineers
- Chemical Engineers
- Electrical Engineers
- Electronic Engineers
- Industrial Engineers
- Mechanical Engineers
- Mathematicians
- Physics

R&D Fields of endeavor include earthmoving equipment, industrial engines and turbines, fuel handling, environmental control, electric power and propulsion, direct energy sources, detectors, bridges and marine craft, mine warfare, fortifications and obstacles, camouflage and deception, water purification, nuclear weapons effects, materials, and environmental testing. Procurement packages consisting of the specifications, standards, drawings and tooling data American industry needs to manufacture quality equipment in quantity are also engineered.

Position grade levels for candidates holding an appropriate degree begin at GS-5 level and range through GS-12 for the exceptionally qualified candidate. Opportunities for graduate work exist at local colleges and universities in the Washington, D.C. area for qualified employees on a reimbursement basis. Representatives of the U.S. Army Materiel Command visit campuses each year to interview qualified candidates. Interested students are asked to contact their Placement Offices for information.

# PRESENTING CONVAIR

...A Great Name in Aerospace

The Convair Division of General Dynamics Corporation is one of the largest and most sophisticated aerospace and research firms in the country. It was formed in 1965 through the merger of two divisions of General Dynamics: the old Convair Division and the Astronautics Division, both in San Diego.

The heritage of Convair dates back to aircraft production prior to and during World War II. In recent years the former Convair Division produced the Air Force F-102 and F-106 jet interceptors, the 880 and 990 jet transports, and the Little Joe solid rocket booster. The Astronautics Division was the home of the Atlas, the first free-world ICBM, and the subsequent development of the Atlas as one of the nation's major space launch vehicles; many other aerospace and research programs were undertaken by Astronautics including Centaur—the first U.S. space rocket powered by liquid hydrogen.

## Company Description

Convair is primarily involved in research, development and production connected with the aerospace industry. Its primary efforts are in complete systems and programs. The spectrum includes space launch vehicles, electronics systems, maneuverable re-entry vehicles, commercial and military aircraft and oceanographic research.

Major programs include the Atlas space launch vehicle; the Atlas/Centaur booster program used to put the Surveyor spacecraft on the moon; the development and installation of complete telemetering stations; conversion programs on Convair military and commercial aircraft; satellite research; manned space systems, and oceanographic telemetering buoys.

## Opportunities

A variety of outstanding career opportunities are yours at Convair in the following areas of concentration: aeronautical, electrical, electronic, mechanical, engineering mechanics, engineering physics.

Engineers will be assigned to the following areas: advanced systems, systems

analysis, space sciences, life sciences, information sciences, scientific data processing, aeroballistics, dynamics, thermodynamics, guidance, structures, mechanical design, electrical design, reliability, test engineering and materials research.

## Special Features and Attractions

Convair offers outstanding fringe benefits including an Employee Savings and Stock Investment Plan to which the Company contributes as well as a Retirement Plan and Tuition Assistance Programs. Convair employees can select from many company-sponsored educational assistance programs and determine for themselves which is best suited to their particular requirements. These programs, held in conjunction with four highly rated local colleges and universities, include a tuition refund plan, an irregular work week to permit college attendance, an advanced-degree work-study program, special courses and seminars, and Doctoral Fellowships, among others.

One of the nice things about working at Convair is living in San Diego... one of the country's truly great resort centers. With only 10 degrees difference between January and July highs, the sunny San Diego climate is pleasant throughout the year.

Two great bays and 70 miles of ocean beaches provide all-year aquatic sports and fishing. Exciting Mexico is just a few miles away. Nearby mountains, a world-famous zoo and a marine park add to the fun... plus 64 golf courses for year 'round play. San Diego is an ideal family city with excellent schools. As the country's 16th largest city, San Diego offers the best in cultural attractions, performing arts, professional sports, and other entertainment. **Come to Convair...Where the Magic of Aerospace Unfolds.**

Please send a detailed resume to:

## ENGINEERS

Offers Challenging Opportunities in

- DEVELOPMENT
- PRODUCTION ENGINEERING
- PROCESS ENGINEERING
- PROJECT ENGINEERING
- MARKET DEVELOPMENT
- SALES

With Exclusive Flame-Plating Process

This is a well established but rapidly growing business with a network of plants and offices in strategically located principal cities throughout the U.S. and overseas. Our metallurgical coatings are needed and used in all industries both defense and non-defense. We are aggressively developing new applications, new materials, new markets and new businesses. Positions are available for engineers, who want to join a live and growing organization, where they can use and develop both their technical and management skills. Contributions are recognized and rewarded while working with operating and management people of our business and our customers in solving engineering, wear and other materials problems in diversified fields. Experience or interest in mechanics, dynamics, tool and machine design, heat transfer, metallurgy, market development and technical sales will be helpful. If you are qualified and interested, send a brief summary of your background to:

MOON HAS BEEN COLONIZED

AND THE SEAS  
MADE HABITABLE

**GENERAL ELECTRIC**

**POWER TRANSMISSION DIVISION**

**WILL STILL BE MAKING INDUSTRIAL EQUIPMENT**

*For the Needs of Those Who Make it Possible  
to Conquer the Moon or the Seas!*

Electricity is the "spark" of all progress! More than 90% of all energy used to power machinery is electrical energy. Sixty years ago, America's industrial plants were powered mainly by water wheels, steam engines, and the muscle power of workers themselves.

Today, electricity is the muscle of all industry, regardless of how it is generated. And, GE its "mentor", through creative research and engineering. At our Power Transmission Division in Philadelphia revolutionary breakthroughs are not uncommon. Take for instance our new air-blast circuit breaker capable of handling power faults of 35,000,000,000 volt amperes in 1/30th of a second... or the vacuum power interrupter which literally "bottles outer space", and creates a vacuum within a glass enclosure... or the world's largest high power-rated silicon rectifier cells manufactured at our semi-conductor facility.

But GE does not rest on its laurels. Just as "Progress is our most important Product"... so is RESEARCH, too, the basis for all progress at General Electric where our engineers and scientists at BOTH graduate and senior levels are constantly searching for new and more efficient ways of doing things.

Continuing research, development, application and manufacturing work in such fields as plasma arc processes, electrical and mechanical transients, vacuum technology, aerothermodynamics, extra high voltage power transmission, both AC and DC, and solid state power conversion equipment, create a constant need for college graduates in all areas of education.

Today's career opportunities are available for College graduates in Engineering — all disciplines, Mathematics, Physics, Chemistry and other fields in

- BASIC and APPLIED RESEARCH
- DESIGN, DEVELOPMENT and APPLICATION ENGINEERING
- PRODUCTION ENGINEERING
- PLANT ENGINEERING
- MANUFACTURING
- MARKETING
- ACCOUNTING • EDP

If you are interested in a "down-to-earth" career connection with one of America's foremost companies, send your resume in confidence to Mr. Ralph Wiggins.

## LET'S GET ACQUAINTED

We look forward to an opportunity to meet you in the near future. The following information about the J. M. Huber Corporation will acquaint you with our company and operations.

Almost a century after its founding as a manufacturer of printing inks and pigments, Huber today is a diversified company producing oil and natural gas, chemicals and pigments, carbon black, kaolin clay, printing inks, and other products. Here is an abbreviated summary of our most important operations.

### Oil and Gas

The Oil and Gas Division (headquartered in Denver) explores for and produces crude oil and natural gas in twelve states and two Canadian provinces.

This Division operates 1600 wells. Some of the gas produced is used in our carbon black plants at Borger, but most is sold to pipelines supplying industrial and domestic consumers of gas for fuel. Crude oil is sold to refiners.

### Chemicals and Pigments

The Chemicals Division has headquarters and laboratories at Havre de Grace, Maryland, and plants at Havre de Grace and Etowah, Tennessee. It produces sodium silico aluminates, known as Zeolox®; silicic acid pigments, and other inorganic chemicals.

These products are used to improve the brightness and printing properties of paper, to condition other chemicals and fine powders or granular materials

to prevent caking, and to improve the processing and durability of rubber products. In addition, our chemicals are used as extenders in paint and ink.

### Carbon Black

Headquarters and laboratories are at Borger, Texas, where both furnace and channel blacks are produced; furnace black is also produced at our Eldon (Baytown), Texas plant. Carbon black is an essential reinforcing agent in rubber compounds, and must be produced to rigid specifications in a carefully controlled petro-chemical process.

### Clay

Huber operates many kaolin clay mines, and clays are beneficiated by both chemical and mechanical processes to meet the specifications of many industries. Constant prospecting goes on to maintain and increase reserves. Overburden is removed by walking draglines and other earth-moving equipment. Clay is mined by smaller draglines and power shovels.

Headquarters and laboratories of this division are at Huber, Georgia, near Macon. Plants are located at Huber and Wrens, Georgia, and at Langley and Graniteville, South Carolina.

### Ink

With headquarters and laboratories at Menlo Park, New Jersey, the Ink Division has extensive production and distribution facilities in the United States. A leading supplier of black and

color inks to newspapers and to the packaging industry, we also supply inks to magazines, comics and paperback books.

### Research

The Chemicals, Carbon Black, Clay and Ink Division each maintains its own research and development facility. Because many of our products have interrelated uses, research personnel frequently collaborate with their counterparts in other divisions seeking solutions to common problems.

Huber has opportunities for engineers and chemists in research and engineering. If you want further information, write to the Technical Director of the division of interest to you.

Chemicals Division, P.O. Box 310, Havre de Grace, Maryland 21078

Carbon Black Division, P.O. Box 831, Borger, Texas 79006

Clay Division, Huber, Georgia 31040

Ink Division, Menlo Park, New Jersey 08837

THIS IS HUBER, a concisely written and illustrated booklet detailing Huber's growth and diversification, is yours for the asking. Write to J. M. Huber Corporation, Menlo Park, New Jersey 08837.

$$E = \int \frac{L \Delta}{\sqrt{Z\%}} \left( \sum_{\Pi}^{\theta} \geq X \div \star \right) \left\{ \begin{matrix} \Phi \\ \downarrow \\ \beta \\ \times \\ \downarrow \\ \beta \\ \times \\ \downarrow \\ \beta \\ \times \end{matrix} \right\}$$

## MAKE SENSE? OF COURSE NOT!

Neither does trusting your professional career to non-professionals. Tech Square's engineer/consultants can help you realize your employment goals practically on a real-time basis.

We provide personnel consulting and placement services for the engineering, scientific and technical disciplines without cost or obligation. Our Cambridge location is in the heart of the academic and scientific communities giving us a wide range of newly created positions each month.

Send your resume or an outline of your experience, in complete confidence to Mr. Floyd W. Brown at:

Space and missile research and development activities at Avco constantly reach newer and higher peaks of sophistication . . . providing young scientists and engineers every opportunity to reach corresponding peaks of achievement and reward. Research and development operations are currently carried out in two separate organizational facilities.

# Greater Growing Room!

## SPACE SYSTEMS DIVISION

Offers exciting opportunities to participate in vital programs concerned with scientific satellites and unmanned planetary spacecraft.

## OPPORTUNITIES

Apollo Re-entry Systems; Planetary Exploration; Scientific Satellites; Guidance, Control & Communications Subsystems; Electric Propulsion Systems; Materials Technology; Heat Protection Systems; Environmental Sciences; Satellite Survivability.

## MISSILE SYSTEMS DIVISION

Currently engaged in large scale programs which encompass ballistic missile re-entry systems, advanced penetration aids for strategic and tactical weapons systems, telemetry and instrumentation, flight testing, maneuvering re-entry systems, and computer services.

## OPPORTUNITIES

Electronic and Electro-mechanical Engineering; Aerospace Vehicle Design; Advanced Systems and Penetration Aids; Test and Evaluation; Reliability Engineering; Arming and Fuzing; Systems Engineering.

Additional advantages of an Avco association are a location convenient to M. I. T., Harvard, and other fine universities . . . plus a meaningful education plan to help finance advanced degree programs. Your associates are top echelons of creative personnel who have pioneered and contributed massively to virtually every aspect of space and missile development. You'll enjoy an excellent salary and a liberal and comprehensive benefits plan.

FOR COMPLETE INFORMATION, WRITE TO:

FOREST SERVICE  
NATIONAL FOREST ADMINISTRATION  
SOUTHERN REGION

## Career opportunities for Engineers in the U. S. Forest Service.

The Forest Service of the U. S. Department of Agriculture has over a sixty year history of land resource management. Under a policy of Multiple Use Management we conserve the basic land resources while at the same time produce high-level sustained yields of water, timber, recreation, forage, and wildlife. These are harmoniously blended into the management pattern for the use and benefit of the people. The Southern Region is divided into 14 administrative National Forest units located in the 14 southern states.

To meet the challenges in managing the land and its resources we employ Engineers which are an important part of our team. Our Civil Engineers carry out diverse assignments in highway, bridge, sanitary,

hydraulic, structural and construction engineering. This includes the planning, designing and construction phases of work. Occasionally we need Electronic and Mechanical Engineers for forest communications and equipment management.

For the man who likes the outdoors; wants to be part of an important mission; and is interested in a challenging professional career with plenty of opportunity for advancement, the Forest Service is worth considering. For further information contact:

### Among the advertisers in this issue:

AIRCO—Air Reduction  
Sprague Electric Company  
Xerox Corp.  
... and many others

will be interviewing at many schools  
this year. Unfortunately, their schedules  
of campus visits either were not avail-  
able at press time or were received too  
late to be included in this list. So be  
sure to check your Placement Director  
for details.

# We have friends in high places

... orbiting the sun... orbiting the  
earth... and even at home on the  
Moon. Like all friends, they have some-  
thing in common. They were conceived  
by scientists and engineers at the Jet  
Propulsion Laboratory in Pasadena.

We've soft-landed on the Moon,  
photographed Mars, flown by Venus, and  
now we're serving notice on the rest of  
the Solar System. And that's only the  
beginning.

Ambitious upcoming missions such as  
Voyager and Mariner '67 have created  
across-the-board openings in a wide  
variety of disciplines. Here's your chance  
to exchange ideas with some of the finest  
minds in space exploration. The very  
same minds that gave birth to Surveyor,  
Mariner and Ranger.

You'll like living in Southern California,  
too. Where people like you are making  
things happen. So, if you're a man with

his eye on tomorrow... we promise you  
the Moon... and we deliver.

Want to know more about JPL? Talk  
to your placement director, or send a  
letter to Mr. Wallace Peterson, Super-  
visor, Employment. Next time JPL comes  
to your campus... we'll be looking for  
you.

**JET PROPULSION LABORATORY**  
4800 Oak Grove Dr., Pasadena, Calif. 91103  
Attention: Professional Staffing Dept. 564

"An equal opportunity employer." Jet Propulsion Laboratory is operated by the California Institute of Technology for the National Aeronautics and Space Administration.

## AVIONIC CONTROLS

*Now...and in the future, at:*

**GENERAL  ELECTRIC**

Our breakthrough for the F-111 tactical fighter is history. Others are now in the making. Which means that the time is ripe right now for you to join our Avionics team.

It's the same team which pioneered the development of the flight control system for the supersonic variable sweep wing F-111. And if you think that was a technical challenge, wait until you see what we're tackling now.

Here are just 4 examples of other areas in which we're currently hard at work:

- Computed Display Systems
- Solid State Rate Sensors
- Airborne Redundant Hydraulic Servos
- Digital/Analog Computers using MOS Devices

Qualified EE's, ME's, AE's and Physicists write to: J. P. Gohrett, Manager—Technical Recruiting, Light Military Electronics Department, Avionic Controls Business Section, General Electric Company, Room 59B, 600 Main Street, Johnson City, New York.

An Equal Opportunity Employer (M&F)

(Be sure and see the other General Electric ad in this issue)

## THE SPREAD-EAGLE OF TECHNOLOGY AT GRUMMAN

*Ranges from inner to outer space*

Grumman has special interest for the graduating engineer and scientist seeking the widest spread of technology for his skills. At Grumman, engineers are involved in deep ocean technology...engineers see their advanced aircraft designs proven daily in the air over Vietnam, and soon...in outer space, the Grumman LM (Lunar Module) will land the astronauts on the lunar surface. Grumman, situated in Bethpage, L.I. (30 miles from N.Y.C.), is in the cultural center of activity. Universities are close at hand for those who wish to continue their studies. C.C.N.Y., Manhattan College, New York University, Pratt Institute, Columbia University, State University at Stony Brook, Polytechnic Institute of Brooklyn, Hofstra University and Adelphi College are all within easy distance. The surroundings are not hard to take. Five beautiful public golf courses are in Bethpage—two minutes from the plant. White sand beaches stretch for miles along the Atlantic (12 minutes drive). The famed sailing reaches of Long Island Sound are only eleven miles away. The informal atmosphere is a Grumman tradition, matched by an equally hard-nosed one of turning out some of the free world's highest performance aircraft systems and space vehicles.

Taking their place in a long line of Grumman aircraft that have contributed to the national defense, the aircraft shown below are performing yeoman service in Vietnam.

Currently, Grumman engineers, pulling the state of the art relentlessly forward, are engrossed in still more advanced aircraft and aerospace vehicles. These include:

Here then is the opportunity for graduating engineers...AEs, EEs, MEs, IEs, Physic majors and Chemical Engineering majors...to take their place in the continuum of technology that is Grumman. To obtain Grumman literature and arrange an on campus interview, contact your placement office.

If an interview is not convenient at this time, send comprehensive resume to: Mr. Bart O. DiChiara, Engineering Employment, Dept. GR-58
